If your IQ was actually larger than the number of letters in your name, I might actually have reason to counteract your reply, but I see it's pointless. You just don't "get it" (as a bunch of other also don't). Let me spell it out for you...

Atari = tree
developers = water
Atarians = branches

The tree has been cut down. Therefore, watering it is useless and the branches wither and die. A few "suckers" (new sapling growth from the base of the tree) have tried to grow from what is left of the stump, but without water, they die too.

If we plant a new tree, there is reason to water it and we should see new growth as well as possibly be able to graft some old branches to it. Success in this effort is primarily dependant upon how much help we get to plant the new tree in the first place and if the groundskeeper will let us do it.

If they don't, there is nothing we can do. But I'm willing to try... are you?

Jared

You stated it not me. True, that these market segments power the
economy. To bad, that a greater precentge of their income goes to
taxes than the higher incomes who pay less. So who gets screwed? And
why nothing has changed?

Speaking of...Any up northers want a bat ball franchise that could be
extinct by next week? Imagine, the Up Norther Twins...

I guess you are confusing formatting and partitioning. Formatting can
never be incomplete with SCSI drives because it is an atomic operation.
Note that the maximum partition sizes for TOS are limited. You should
consult the HDDRIVER manual and online help for more information on
these limitations, which are not imposed by HDDRIVER but by TOS.

> buy new, today, that would work is very welcome.

Any SCSI drive should work, but given the TOS version present in the Stacy (TOS 1.04), partition size can only be 256mb per partition (AFAIK).

Anyhow, using today's huge drives, this tends to mean either more than 4 partitions (which a lot of older software doesn't like) and part of the drives that exceeds the maximum size accessible by that old TOS version.

SOLUTIONS

1) Find a small SCSI hard-drive. About 1GB should be more than plenty.

2) Upgrade to TOS 2.06 - this one has a caveat, in that some music software behave stangely using this TOS version. For instance, Notator refuses to start on its ows, it must be started by Softlink.

CAVEAT

Disassembling the Stacy (and even worse, re-assembling it) is a real pain in the ass and quite honnestly best left to professional repairmen. Too many parts are interconnected in cumbersome ways, the LCD's wiring harness has WAY too short wires that hamper the assembly/disassembly procedure and they are so tiny that they can too easily be broken and certain parts sit WAY too close to the shield which adds to the risks of shorting components by accident. Definitely NOT for the faint hearted!

> (Aniplayer+Lame_060.slb under Mint) and it takes 189 secs for encode of 27

With a short WAV 44,1KHz stereo of 8,5 seconds, on my Falcon/CT2B I need
5 mn for encode this file with the default settings in the MP3 box.
An Hades user reports 27,5 seconds for encode the same file (8,5 s).
So the hades seems 11X faster than my Falcon/CT2B and seems 2X faster
than your example, but maybe it's not true because it's not the same
file, and I haven't an Hades for verify myself.

> secs of music. I donï¿½t know how fast is it related to real 68060 based
> machine, but I think itï¿½s probably same fast or even faster. Anyway, Itï¿½s
> 30 times faster than my Falcon with FPU.

I have just encode the same wav unde my Falcon in normal mode in 896 x
608 x 16 colors, I must way 40 mn for encode the same file.
In 640 x 400 x 2 colors, I must wait 33 mn.
The library used was 68881 version.
In this conditions Hades seems a minimum 70 times faster than my Falcon
in normal mode, for just a 60/30MHz clock ;-) I must obtain better
results under the future CT60 with a 68060 overclocked at 80 MHz and the
SDRAM at the same frequency.

> > For me emulation is _NOT_ the solution.
>
> Well, the 68k family of processors is dead. The fastest one, the 68060, is

Not totally, there are the coldfire but it's another story.

> still slow for many tasks. Thinking about DVD, DivX or at least VCD ? Dream
> on. If you want a faster CPU, then you must move to another line of CPUs
> and it means emulation.

Please wait the CT60 results, today there are no 68060 card with SDRAM.
There are limits with a 68060 overclocked, but for me inside the Falcon
there are some interrestings features like decoding littles divx by the
68060 and play mp3 track by the DSP 56001 in the same time. The 1st

limitation is the Videl, not he 68060. And the videl is just used for
video, not mp3 encoding.

> Of course the 68k emulation is not the goal, but only the first step. Then

Humm, yes like the Coldfire project, maybe some programs.

> P.S. Sorry to all native english people, my grammar is probably very bad. I
> hope you uderstand ;)

Me yes ;-) because I have the same problems, this NG I don't know ;-)

Please continue your great project, I see it's not just for PC computers
;-)

Regards,

Didier.

Sorry you have to make this announcement here, Kenneth.
comp.sys.atari.announce sucks. I sent a message announcing the new
version almost a week ago, but it never appeared. I'll ignore that
newsgroup from now on.

>Hm, Jos den Becker earlier said the Okami project would not be worked on
>any more. This looks like a kind of "inverted vapour ware" to me. Not too
>common in the Atari world :-)

I'm not sure I know that "inverted vapour ware" means, but if I
remember correctly I said I don't have much time to work on Okami
anymore. As it happened, I had some unsuspected extra time to devote
to my "crazy projects", and here are the results. Hope you enjoy the
new features. But be prepared for a truckload full of bugs. Today I
uploaded version 3.0B-4. :)

> So the hades seems 11X faster than my Falcon/CT2B and seems 2X faster
> than your example, but maybe it's not true because it's not the same
> file, and I haven't an Hades for verify myself.

Well, the real 68060 has a very fast FPU unit. Aranym FPU is also fast, but as said, it's still unoptimised and it uses no MMX, SSE or 3Dnow!, only plain i386 code.

> In 640 x 400 x 2 colors, I must wait 33 mn.

I also tested in mono (Falcon) with longer WAV file, but got exactly the same result (ratio about 230:1).

> > Well, the 68k family of processors is dead. The fastest one, the 68060,
is
>
> Not totally, there are the coldfire but it's another story.

Coldfire are nice, but not fully 68k compatible.

> Please wait the CT60 results, today there are no 68060 card with SDRAM.

True, but you shouldn't expect too much from it. It probably will be much faster than Hades 060, but it will be still slow for smooth VCD (mpeg1 + Layer2 soundtrack) replay. I expect 8, maybe 10fps with current Aniplayer implemenatation and DSP for sound.

> There are limits with a 68060 overclocked, but for me inside the Falcon
> there are some interrestings features like decoding littles divx by the
> 68060 and play mp3 track by the DSP 56001 in the same time. The 1st

But people want to replay all DivX files, not only little ones.

> limitation is the Videl, not he 68060. And the videl is just used for
> video, not mp3 encoding.

Yes, that is another point. I think 68040/68060 based Atari without graphic card is nonsense.

regards,

Ctirad

I am sure Uwe will see this thread and give you a better answer, but
the only thing I can think of is that the 1gig limit may be a resulting
limit of regular TOS. If you are trying it under BigDos, Mint or Magic,
then I am not sure what the problem could be. I know I have formatted a
2 gig drive with HDDriver while under Magic (on my Hades060)....

Yes, you can use a serial mouse if you have Mario Becroft's adapter.
There is also some software that does the same thing, but I am not sure
how good it works. An Atari mouse is very cheap and is sold at most
places that sell Atari products...

Hello.
I use Platon for about 6 years. It can help you drawing PBC up to
6 layers, has a good library of chips (54xx series) and export
the schemes to industrial file format. You can of course print to
a standard printer. I forget some other things.
I bought it from APAK in Paris. I don't know if it is still
available. This soft runs only in ST monochrome high resolution.
Don't hesitate to mail me if you have some other questions.

Regards.

I've always used an old (but in my opinion, invaluable) utility from
The CodeHeads called MAXIFILE III. For those that aren't familiar
with it, it's a file copying utility somewhat similar to Kobold, but
it came out quite a bit before Kobold. It also offers numerous other
useful functions - such as setting the FASTLOAD bit.

I don't know if it's still available anywhere, but I do know that
CodeHead Software shut down back in the early '90s. Maybe you can
find it on an FTP site somewhere. Send me an e-mail and maybe we can
work something out - I think you have my address?

4818. We at TAMW need interrupt driven midi out routines

Newsgroup: comp.sys.atari.st
Date: 2001-11-05 22:45:44 UTC
From: g.goebertus@chello.nl
Message-ID: <3be71183.6889022@news.ams.chello.nl>
Source record: 40737

Hi all,

Tim's Atari Midi world at yahoo.groups is the place to be for Atarians
using Midi software. Perhaps you have heard of it.
However, some of us there still like to develope some new midi
software of our own. So far, so good.
There is one major problem however.
There are (x)bios routines for midi out like bconout() and midiws()
but they are pretty useless, because they wait until the character is
send before returning.
What we need is a interrupt routine that takes care of that.
It should be some kind of buffer where the main application can write
to, while midi out is taken care of in the interrupt routine.

There are some talented programmers on this list.
Anybody volunteering?
Would be sooo cool!

OK, one thing that has to be beared in mind is that those 3.5mm jack
sockets aren't very good. I've seen these sockets were out and to make
the sound better you have to turn the plug in the socket. Can you not
locate the problem, have you tried some headphones right in the socket.

Dude, you should be OK doing this :) SCSI is designed to be daisy chained
and it seems like you're following the rules. I have Zip and Scanner and
it's OK. I would say you should keep lead length down, you may be unlucky
with a bad lead.

Hi Hallvard!

After complaining about Ben's 'commercials' I am a little loath to
post this :-)

Not free, but Scooter-PCB that I distributed in the English
version would do that very well. Price was ?55, but I have no more
copies or manuals left. Try the author to see if he has any left
in German (or English). Email him on:
hkahlert@hk-datentechnik.de

>A program which could be used to draw schematics would also be nice

That Scooter won't do. But there are several German PD programs
that will, such as E-plan, Schaltplan and Transistor. Can't recall
if they have drivers for anything but pin printers, though. In
fact, I think you have to make a hard-copy off the screen for some
(Atari's only works for 9-pin printers, but Imagecopy is OK).

Unfortunately there is nothing on the Atari that will convert a
schematic to a layout - for that you need (rather expensive) PC
programs :-(

Regards, /Peter/

From: Bill Freeman <flipflap@coastalnet.com>
Date: Sun, 04 Nov 2001 16:24:43 GMT

Hi Bill,

>I still use my TT, It's a great computer, but why upgrade it when there
>is so little new software. All the software I have works just fine in
>6mb of memory.

If the software you use runs just fine in 6MB then no, by all means don't waste money on a useless expansion. But to get me back behind a unexpanded TT you'll have to put a gun against my head and even if you would pull the trigger there's no way you'll get me back behind an ST.

>You can buy a complete 1ghz PC for less than the current price of all
>this upgrade stuff for a TT. For internet use, you can buy an old Mac or
>PC for less than the price of a Magnum card alone for the TT. .

I agree... But you've missed the point. The point was that someone could achieve the *same* thing on a Atari MegaSTe, Falcon or TT. If this thread has shown one thing then it surely is that some of the people here are not willing to use anything else then a computer that carries the Fuji logo, whatever it takes and whatever it may cost. Price wasn't an issue in this thread (not until now that is).
And you forgot to mention the Milan, instead of spending all that money upgrading what is basically an old computer, one should consider upgrading to this clone. A basic Milan will cost you roughly $850, and will outrun the described power-TT in every respect. Following your logic the Milan isn't "spending" money but should be regarded as a "investment". In a couple of years these computers will be sought after, and since these are very rare and hard to come by...

>How much money is a Magnum card? A graphics card? A Riebl card? .

A bare Magnum card will cost you $85 and EDO SIMM's can be obtained from various sources at ridiculous prices. The Galaxy graphic card costs IIRC less then $200, that's the only card available. Depending from what source you obtain the Riebl card expect to pay from $80 all the way up to $200. A future update from the Galaxy card will be able to address networks, so the Riebl card isn't really necessary anymore.

>Where do you find this stuff? Not in the USA. The dealers are GONE from
>here

Yes I realise this, but if you think that all I have to do is pop outside and rush to my local Atari dealer... well that's a serious misconception. Here in Belgium there aren't any Atari dealers at all since many years,

whatever I buy, I have to order through mailorder so basically I'm taking the same risks as you would. If you order from a dealer which isn't really thrustworthy you'll be taken for a ride... always insist on paying with a credit card, if they refuse to accept this kind of payment then tell them were to stick their stuff and contact a dealer that accept them. Always insist they mail the goods by UPS and demand the shipping code (so you can track the shipment down on internet).

>Since Atari programs are small, any Atari software found on the internet
>can be downloaded to a Mac or PC and transferred to the Atari via a
>floppy

Perhaps the software you use can be transfered that way, but I would love to see how you would transfer Calamus, Papyrus etc via a floppy. Just go and download the demos and you'll see what I mean... and remember these are only cutdown versions of the real thing ;-)
OK, I know that you ment something different... but from where I'm sitting it's a ridiculous suggestion. Any Atari is capable of accessing internet just fine, so there's no need to start messing about with floppies.

>A 1040 ST, along with a color monitor can be found for less than $50,
>and works for most of the great Atari games still not available on any
>other platform.

Yes :-)

>Many Atari games won't run on a TT, and those that will usually won't run
>on the TTM monitor. I had a Falcon, and a lot of ST programs wouldn't run
>on it either. If you want to run ALL Atari programs, you're going to need
>three Atari computers.

Yes, but... there are games and serious apps available that can run on any Atari, which only goes to show that it's not impossible. The reason why certain software doesn't run on certain models beyond any doubt is the programmer which either didn't follow the Atari guide rules or was rather shortsighted.
Furthermore the TT and ST are complete different computers. Considering the move from 16bit to 32bit, the number of titles not running was rather small. The TT was Atari their flagship, it was marketed as a professional computer for profesional users, the last thing Atari wanted was people starting to play games on it. I suspect they did everything they could to make sure that the "mountain" of games wouldn't work. Have you ever seen one single advertisement from Atari marketing the TT as a games or even a computer for general use? I certainly didn't.
When the Falcon was lounched Atari stopped producing the STE and some six months later officially announced that the ST/STE was history. From that day on we shouldn't really discuss ST compatibility anymore.

>I have not found any Atari emulator for my G3 Mac that works as well as
>a real Atari.

Are you referring to Nostalgia? Ever heard of MagiCMac? This emulator will transform your G3 into more or less a power-Atari like the one described in

this thread. And you're in luck... the North American devison of ESNA will
be delighted to sell you a copy. Get in touch with Bengy Collins.

Cheers from Belgium
Dennis

Hi Jared,

>Here's a question. Is the "Atari" market outside of the US still thriving
>or is it truely dying as well and what would you say is the main cause of
>it?

Well, it's not really exactly thriving. But to presume it's truly dying is
a rather biased opinion. Let's say that the patient is in very bad shape,
but that his condition has been more or less stabilized....

>If the Medusa/Milan were to have a continued upgrade path (say a PowerPC
>model with emulation or such), do you think people would buy it in the US
>or elsewhere.

No.
The only potential buyers are existing Atari users, to pull them over the
line the hardware itself is not enough. Without software that adresses the
power of these computers the majority will stick to what they've got. So
the first thing we need is software that is written for these computers.
Forget about compatibility with the ST, Falcon and TT since that's the
limiting factor. Don't ask me what kind of software, the answer is simple:
all kinds. But it should be able to compete with what's available for the
PC and Mac platforms. Anything less simply won't do.

But now I'm daydreaming as well.... one dreamer in this group is about all
we can take, so I'll put a sock in it ;-)

Cheers from Belgium
Dennis

Can't you "hook" the interrupts using Mfpint()? I am trying to write a
utility which transfers files between STs using the MIDI ports, and I
did stumble across this (and Bconmap()) the other night (haven't
tried to implement anything with it though)

Source record: 40745

My TT030 was doing some strange things, mostly minor, but when it refused to run a multitasking AES, although called by a running MiNT 1.15.1, and refused to copy things into drive U (this did work before), for lack of anything else to try, I decided to back up the drive to ZIP disks (because Gemar reported a read error on a good tape) and re-format. Along the way, I found that ZIP disks do die.

Before reformatting and repartitioning, I copied down the partitions found by HDDriver 8. The drive, a 2-gig, had been formatted with ICD Pro. After that lengthy operation, I typed those partitions into the proper place on HDDriver 8, and was advised that I had called for use of 0.2 meg more than the capacity of that disk.

Have not finished reloading programs, or finding copies of those on the dead ZIP disk. Anybody know where that notice that I had my hard drive formatted for more disk space than it had came from?

And what about CircuIT and RouteIT?
AFAIR you can draw schematics and let them automatically convert to a
layout.
It were under the distribution of Maxon, I think.

Wait a sec... wasn't it a letter to Hasbro? If you have a copy of the post I made, that would verify if I sent it to Hasbro or Infogrames. It's been awhile and I've been busy tending to duties of home and family, so it's been kinda forgotten.

I deleted all my backed up "Save Atari" materials shortly after, when it I saw it seemed pointless to change peoples minds and I got no reply of any kind from Hasbro/Infogrames.

I'm not trying to break up the remaining Atari users. What I'm TRYING to do is make my point that if we *band together* to a common goal, just as the people over at:

http://www.beunited.com

have done (in their efforts), we can at least say we tried our best. But if being where you're at is sufficient for you, there's no changing you mind, I guess.

The bottom line is, if they don't want to move, we can not move them.

Perhaps the problem is at the other (receiving) end. I suppose you
used bconin() for that?
I have not yet used bconin() myself, so the following may very well be
incorrect:

I have been told that bconin() makes use of the iorec() buffer to
store incoming data temporarely, but the buffer is very small. (80
characters IIRC). The size of the buffer can be changed with iorec().

That would explain why (smaller) text files are ok while larger AVR
files are corrupt: buffer underrun.

Just quessing:-)

>

kinda duh...!!!

>I deleted all my backed up "Save Atari" materials shortly after, when it I
>saw it seemed pointless to change peoples minds and I got no reply of any
>kind from Hasbro/Infogrames.

You want ME to come up with a copy of YOUR post that YOU have no copy of?
I reiterate....duh...!!! For all I know, you could have insulted
Hasbro/Infogrammes with your familier "pointless to change peoples minds"
attitude!
Did you tell them they'd better revive Atari computers or else....?
You are the one who is "pointless"! I remember you calling people here
"quitters" and you can't even keep a file on the issue saved?
Who is the quitter?

>
>I'm not trying to break up the remaining Atari users.

Good too hear! You can't anyway :)

>What I'm TRYING to do
>is make my point that if we *band together* to a common goal, just as the
>people over at:
>
>http://www.beunited.com
>
>have done (in their efforts), we can at least say we tried our best. But if

Sounds like your ZIP disks/drive may be suffering from "the click of death".
If you had (or have) Windows, you could use a Zip drive/disk testing program
called "Trouble in Paradise" (TIP), which would let you know when your
disk/drive is suffering from this fatal problem.

From my experience with commodores they didn't transmit the data serially
as in the ST range but just provided a matrix of keys which are scanned.
I don't know how the 800 works but if it was just a matrix it could be a
tiresome job. You'd need to get information on the IKBD protocol and scan
your 800 keyboard. Actually a PIC chip should handle this OK, one with
the serial I/O functions.

I forgot, 1mb is actually the maximum drive size supported by the internal
controller.

Also, be sure to choose a low-power drive. I accidentally blew-off the
12v supply on my Stacy by putting a drive that was not low-power...

It probably down to the interpretation of the size of a Kbyte for the
software author, in these cases i'd delete the size info for the last
partition and then click on divide, the remaining space is then calculated
and allocated to the last available partition.

> Have not finished reloading programs, or finding copies of those on the
> dead ZIP disk. Anybody know where that notice that I had my hard drive

It might be dirty or worn drive heads, try a ZIP drive cleaner, but whatever
you do don't format or dispose of those ZIP disks until you've tried them on
another ZIP drive. I have 3 ZIP drives and if your local post wise would be
happy to test them in my drives for you.

Here's a clip from the Readme of an APP called CLA, I have no idea as to its current evolution but suggest this may be all you need anyway if used in conjunction with Scooter as mentioned by Peter West.

---------- Clip Start ----------

CLA v3
========

This is the sixth beta release of the CLA3 electronic CAD system,
and the first general release. This release is just the schematic
and simulation sections (as far as I've got).

Anyone who has seen CLAv2 may be a little shocked by v3, as it is a
total re-write from scratch. Some features of v2 haven't made it into
v3, but the editor is a vast improvement over v2 (well, it should be,
I've spent a year or so on it). The simulator lacks some of the v2
features (interactive mode is the big one), but tries to make up for it
by being easier to use, and providing larger stimulus (the window now
scrolls).

If you've not seen v2 (and I hope everyone forgets about v1), you
should be in for a treat - CLAv3 aims to be a 'real' EDA system,
so it provides hierarchical designs, libraries, multiple windows, GDOS
printing, simulation, auto-routing, and lot's more, all wrapped up in
a DULIB GEM interface (windowed dialogs, AES4.1 support, colour icons,
etc).

---------- Clip end ----------

Source record: 40619

The thing is, I was wondering...

1) If we actually did restart Atari (hypothetically speaking), do you suppose a "Super ST" (basically a 1040ST with a 16MHz (or faster) 68000, 16Mb of RAM, better video/audio (, etc., but with "transulators" (translating emulators, via FPGAs or whatnot)) in place, so that old software thinks it's talking to the old hardware, but it's calls are being "translated" to the new hardware) would be a worthwhile item to sell? TOS would be patched to "sense" the old software calls and engage the transulators, but new software would access the new hardware straight out.

2) What about a PDA device (similar (in function) to what Palm, HP, and Handspring sell)? I thought that a "kid/teen" version, sporting the Atari fuji symbol as the shape/look of it's case, would be awesome!

3) What about taking MultiTOS and "amping it up" for today's technology? I always thought that it would be neat to improve GEM in so many ways that it could be renamed "GEMillenium".

4) And then, applying it to a PowerPC-based computer, with all the trimmings, like 128Mb of RAM, nForce video/audio chipset (maybe even ATI's Radeon chipset and Creative's SoundBlaster chipset), USB, TOS/GEM in EEPROM (never change a great thing, but make it user-upgradable), etc.

Let's just pretend that any of this actually *could* happen and let me know what you think about it. Afterall, if we do what BeUnited is doing (and has done), we could just make it happen!

... provided you actually WANT to try and reverse the death and decay of a great company run in to the ground by bad management. :-)

4858. C LAB Creator sluggish on 1040ST

Newsgroup: comp.sys.atari.st
Date: 2001-11-07 16:43:58 UTC
From: garthrr@aol.com
Message-ID: <20011107114358.01376.00001112@mb-bh.aol.com>
Source record: 40620

I have an old 1040ST on which I run the C LAB midi sequencing program "Creator". I'm wondering what it would take to speed up the computer's performance enough to avoid lag between mouse clicks and command execution. Besides the lag time there are a fair number of times when the mouse click gets no response whatsoever. I dont _think_ the mouse is at fault as this seems to happen with several different mice I have.

If someone knows how to get some more performance out of this computer I would love to hear from them. I dont mind spending a few hundred to make the thing work smoothly. I would also like to know what other models of Atari will run Creator. I am told the Falcon will not.

Thanks,
Garth

Not really.

In that price range, you are better off not using the auto-router. Even in the 10k+ price range, I have yet to see an auto-router that really gets in the vicinity of a manual layout.

I have heard that doing this can cause them to fail but it is a simple
component to replace and while you replace it you put a better rated
component in to stop it blowing. Loads of people had modified the
monitors so someone will pop up here with the right part to replace.

Well, I am a Atari 800 enthusiast. I like having another Atari product, a 1040 STE, used and repackaged as the fictional "890 ST Interface" (based on the 1090 XL Interface idea) for use with the Atari 800. The "890 ST" handles 80 column interpretation, SIO2PC disk images (800XLDJ), and other functions.

I would like to have one keyboard. So if there was a way to switch the 800 keyboard for use with the 800 or ST functions, that would only further link the 8-bit and ST worlds.

Just having fun over here. But yes, probably need to map it out. I remember when my dad converted a XL keyboard for a Atari 400 it required rewriting the keyboard protocals, burning a new eprom, jumping wires. As I look back on it, simply amazing. :)

Anyway, just seeing what I'm getting myself into.

Doctor Clu

PS: In my questioning on this, I have heard back from someone trying to convert a ST keyboard for a Atari 8-bit. That too is interesting.

4865. FS: Atari STacy 4 Portable

Newsgroup: comp.sys.atari.st
Date: 2001-11-07 22:54:44 UTC
From: rustynutt@hotmail.com
Message-ID: <fc53daf3.0111071454.29f9a795@posting.google.com>
Source record: 40628

Atari Stacy 4 in great condition. 40mb hard disk. Decent battery and external power supply. Screen looks about right for a STacy, but if someone has a scientific method of determining its luminance, let me know. Keyboard is puss, way better than a Falcon or TT. Does it have a kit installed? I don't know. Will do a "how long does the battery hold a charge test" tonight if a body is interested. Software? We'll discuss that by email. Shipping. Buyer is totally responsible for shipping. You tell me how you want it packed and shipped. Be specific. You will be paying for the service. My zip code is 93555. A STacy is hefty, and be sure to include packing weight. While your looking at the Atari museum to be sure this is what you want, look at the specs for actual weight. $450.00 USD. Prefer payment by PayPal, so get that credit card out. Otherwise, payment by cashiers check or money order due within three (3) days of saying you want it. That will likely mean sending payment Express mail or FEDEX. I won't hold the machine after that. However, if your payment arrives late, I will be kind enough to return it. The STacy will show up on EBAY in a few days to get a little more coverage, but thought of letting the die hards have a shot first. If sold here, I have a box that weights about 80lbs, full of Atari hardware. I don't remember what is in the box, external disk drives, monitors, some cartridge stuff and more. Don't ask me to look inside. I'll ship that box UPS ground, separate from the STacy. In the EBAY auction, the box of stuff will not be included. Any questions just email me. Lots of other Atari software and hardware, but will only discuss inclusions to this deal, no separate sales, so please don't ask, I won't reply.
Thanks,

Mike

So where is my CT060? My soldering iron is still hot.

4866. SPIN works again.

Newsgroup: comp.sys.atari.st

From: nospam@zonnet.nl
Message-ID: <zajG7.10856$Op.51077@zonnet-reader-1>
Source record: 40629

My SPIN is working again. Some time ago my QED editor went crazy: edited files were mysteriously deleted when I tried to save them, scrolling in a window made texts unreadable, strange characters appeared on screen, and I had lots of crashes. Just deleting and re-installing the QED.APP file solved the problem. But in the mean time I had edited some text files and saved them with my crazy QED. One of them was the config.sys file that is used by both METADOS and METAXBS/SPIN. I now found that this may have caused my problem. At first sight it looked OK, but when I looked in QED's file/info menu I saw "Apple" in stead of "Atari" as new line method. Changed this and resaved the file and now everything works as usual again.

I heard that a newer version can be bought from the author that supports longer filenames? Anyone here who uses that version?

Martin

4867. Calamus Export Q

Newsgroup: comp.sys.atari.st

Hi All

I might be getting some software released soon that has documentation originally done in Calamus.

I have Calamus (although I do not use it much:-)But I was wondering if there is a way to EXPORT the Calamus document into a more "universal" format such as RTF , or PDF. Are there such "modules" for Calamus?

Thanks in advance

Hi Gareth

I would say you need more memory. If you go to the Atari Quick Faq
page (just google.com it)there is an excellent section on how to
upgrade.
Also I would point you to Hallvards excellent forum for Creator/
Notator users.

http://www.notator.org

There is also my own Atari-MIDI forum. Check out my site for details.

OK, turn off the Nemesis and see what happens. If the crackling is still
there it could be a slighty dodgy clock patch or even something wrong with
the sound system, although unlikey.

I wanted one of these and actually found this software, it was from the
guy who wrote XaAES before Henk took the project over. I tried it on my
Falcon but all the icons were messed up and colours were wrong. Perhaps I
should try it my the STE. Hmm, it sure looked promising for me. I know
it ain't going to be able to kill some of the logic simulators on the PC
but for simple stuff it'll be nice. IIRC it had source code available for
Lattice C but I doubt I could do anything useful too it.

In the early Atari days, before TOS was localised, there used to be a
language disk distributed with your computer if it had a foreign TOS.
Others might be able to supply you with a copy or suggest more
contemporary solutions.

Its almost as if the computer is still processing the last command while I'm asking it to do something else. For example, if I have a sequence playing and I hit stop, then hit play again quickly, there is frequently no response to the play command. In other words if it were the screen redraw then I assume I would hear the sequence begin even if the graphics didnt show the play button "moving". If I hit stop, then wait three seconds and then hit play it always works.

I will check out your group Hallvard, thanks.

Source record: 40640

I got the bright (maybe not) idea that I could take the cover off the monitor and find the controls inside that control the size of the picture. I was successful and made the image much larger than it had been. Great! A few weeks later the screen went black. Did I over-tax the electronics by doing this? Is there some reason why the standard settings only use about 3/4 of the apparent screen area?

Also, can these monitors be repaired anywhere in No CA? What should I expect to pay?

Hi Joakim,

>Just curious, if someone is posting news about a commercial/shareware
>program being updated in this forum, is that spam too? Where do you
>draw the line?

Personally I don't object to it since I consider this to be information,
even if that information is useless to me. I don't object to individuals
announcing a sale on eBay or trying to sell some of their soft/hardware
here either, I don't object to dealers replying to postings informing us
that the discussed items can be obtained from them, on condition ofcourse
they make it clear that they have a commercial interest and state a price
for the discussed item(s).

But I do make the distinction between announcing information and someone
running a business trying to persuade me bying stuff from him in a manner
like Bravo Sierra does. Well, that's where I draw the line...
It's not the messenger that annoys me but the message, these weekly two
postings I've been subjected to for years, contain no message other then
a couple of links. You realise we are talking about a dealer here which
asked us for well over a year where he could possibly obtain a MegaST?

>I don't agree scanning headers is a waste of time, but that is a matter
>of taste then.

It depends, scanning the headers of a group with an average traffic of 60
postings seems a bit pointless to me. But assuming that the traffic here
would be 500 postings a day and binary attachments were allowed then it
would be a necessity.

Cheers from Belgium
Dennis

** Stuff deleted about CLA **

CLA is really a logic simulator, a good one, as I used the beta years ago to design an ST CPU speed switcher. I think it's unsupported now, as the programmer went on to bigger & better things.

AFAIR, it did not have any layout facilities, it did not have the full range of electronic symbols, so it's not great for drawing schematics either.

Still, it is a great package, very useful if you want to model simple logic circuits & see the effect of changing the inputs.

I didn't expect to find Calamus free on the internet.

> OK, I know that you ment something different... but from where I'm
> sitting it's a ridiculous suggestion. Any Atari is capable of accessing internet
> just fine, so there's no need to start messing about with floppies.

It's not ridiculous to me, because even my TT with CAB and Sting is
inadequate for accessing many, and maybe most present day internet
sites. So if I want to access a site using Java or Flash and other
similar stuff or have SSL so I can purchase something over the internet,
I need another computer anyway.

I think it's great that there are still those like you who use an Atari
exclusively. I wish I could, but I'm finding I can't get by even with
both Atari and Macintosh. I'm going to have to buy a PC because I'm an
engineer, and 90+ % of the companies I deal with use Autocad which is
only available for a PC. Even though I have Vectorworks for my Mac
which claims Autocad compatibility, it's not completely compatible. I
can futz around and manage to convert and read their Autocad drawings,
but I can't expect them to screw around trying to read my drawings on
their PC.

I doubt that Atari deliberately did this. A lot of games violate the
programming standards that Atari specified.

>Have you ever seen
> one single advertisement from Atari marketing the TT as a games or even a
> computer for general use? I certainly didn't.

I've only seen about two Atari advertisements for anything they ever
made, and neither of them was for a TT. The stupid fools basically
never advertised anything they had.

Whatever the reason, poor programming or new hardware, it's hard to make
a program compatible with a computer that will be built sometime in the
future. Plenty of ST business apps. won't work on my TT.

> Ever heard of MagiCMac? This emulator will transform your G3 into more
>or less a power-Atari like the one described in this thread. And you're
>in luck... the North American devison of ESNA
> will be delighted to sell you a copy. Get in touch with Bengy Collins.

Having owned an ST since 1985, I've pretty much heard of everything that
has anything to do with Atari since then. :-)

The Magic Mac demo instructions are only in German, and the demo is so
crippled that I can't tell for sure if it will do what I need it for.
I did contact Bengy. He only has MagicMac v 6.1,(not the latest
version) and it's in German. It's unclear if the version he sells comes
with NVDI. If I buy it directly from ASH, MagicMac will cost nearly as
much as I can sell my TT for. Nobody seems to sell a version with
english instructions, and I don't have time to learn German just so I
can spend $150 for a piece of software that may not be an adequate
substitute for my TT. ASH is a lot like Atari corp, they don't care if
anybody buys it or not.

4885. Codewarrior and Atari ST

Newsgroup: comp.sys.atari.st
Date: 2001-11-08 16:20:52 UTC
From: Ian <info@dotqr.com>
Message-ID: <1005236447.1882.0.nnrp-07.9e98e6ee@news.demon.co.uk>

Some time ago I heard a reference to a module
which could be used to cross-compile Atari apps
using Metrowerks Codewarrior on a Mac (ie. an
ST code generator). Ive been unable to find any
references to this - anybody any ideas?

Ian.

4886. Long File names under emulation (In particular GEMULATOR)

Newsgroup: comp.sys.atari.st
Date: 2001-11-08 16:51:26 UTC
From: David Wade <dave.wade@compaq.no.spam.please.com>

Source record: 40550

Folks,

I am busy trying to catalogue and back up to CD my collection of floppy disks and downloads, and as a result have been running Genulator 2000 on my PC, because whilst its probably the least compatible emulator, its seems the quickest on my PC.

Any way I am now very used to creating long file names on my hard drive, which are a complete pain when viewed under Gemulator. Is there a way to get long file name support in Gemulator or must I try and remember to keep the windows ones short....

Dave.

> format such as RTF , or PDF. Are there such "modules" for Calamus?

It all depends which Calamus version you use.
With Calamus SL 2000 and the bridge 5 module you can export Calamus docs to for instance PDF. Bridge 5 module can only be used with Calamus SL 2000 or newer. Older versions of the bridge module which works with SL 95 or SL 99 can't export to PDF but you can use PS or EPS.
Also there exist a rtf export driver. The latest version works only with SL2000 or newer. Older versions of that driver will work with SL 95 or maybe older.

>What's wrong, and is there a way to fix this?

At first glance, it seems more like a speaker problem. I have the
same thing with mine - I have a pair of Sony amplified speakers and
one of them must have a faulty connection somewhere. At higher
volumes, and especially on bass beats, it crackles and sometimes the
sound goes altogether. I can affect the problem by fiddling around
with the cable that goes into the speaker.

But if it's only happening to you on *some* programs - I don't know.
Try turning the volume up when using other programs and see if the
problem occurs then.

OK dude, it was a very old version I had and the readme did talk of
progress, I was wondering if any current version that existed might have
done what Hallvard required.

>If the latter, have you added any new AUTO programs or ACCessories
>lately?

Its been this way for years at least, if not always. Some years ago a friend added a virus killer and mouse accelerator to my program disc and I seem to remember something changing at that point, perhaps. It was probably 10 years ago and I just dont remember clearly. Any chance that could have damaged the program? I considered it a good move at the time because a large number of my disks were infected with viruses.

>Is there a work around for this?

I ended up removing Xboot as MAgic has to reset to make itself resident as
it completely ignores TOS. Everytime I did a restart Xboot would pop up
which just annoyed me. There are some programs that will disable/enable
xboot but they don't check to see if Magic is active so they weren't that
good.

|
| No.
| The only potential buyers are existing Atari users, to pull them
over the
| line the hardware itself is not enough. Without software that
adresses the
| power of these computers the majority will stick to what they've
got. So
| the first thing we need is software that is written for these
computers.
| Forget about compatibility with the ST, Falcon and TT since that's
the
| limiting factor. Don't ask me what kind of software, the answer is
simple:
| all kinds. But it should be able to compete with what's available
for the
| PC and Mac platforms. Anything less simply won't do.

After a lot of soulsearching, I bought a PC this summer. I wanted to use speech recognition software and there was nothing for the Atari. There had been talk of the Phenix team working with a ?Danish company to provide such a program but Phenix went down the tubes. If the program had been there I do not think I would have changed - not until my machines gave up, that is. (The one thing which allowed me to change was the availability of Papyrus on the PC. I would have found it very difficult to transfer all my files over to Word (even if I had wanted to).) I'm not totally out of the Atari scene - I still use a T36 Mega ST in work as a word processor.

Making the screen larger does put somewhat more load on the
"electronics". Usually an SM124 can be repaired quite easily. There
should be instructions for fixing it on some of the usual Atari FTP
sites. It's usually the 2.2 mfd electrolytic capacitor that blows.
There are also a couple of fuses in there that you could check. I have
replaced the 2.2 mfd with a tantalum, and never had any more trouble
with it.

Calamus 2000 Lite will import older Calamus documents. There is also a
PDF printer driver for Calamus 2000. For just under $100 US you could
create PDF documents.

I'd get an Atari emulator running in a Windoze laptop in a moment if some smart hack could teach it to run Notator SL.

I STILL keep a Mega4 with TOS 1.02 just to run that one application. Calamus is nice on a 32mB TT, though.

I bought my Magnum card from Atari Workshop in England. Very
reliable, in fact. But I think I got the last one ;-).

>
>>The Galaxy graphic card costs IIRC
>> less then $200, that's the only card available.
>
>I wasn't aware this card was actually finished and for sale. Are you
>sure?

I'm using a Galaxy in my TT right now and it is sweet! It actually
cost $250, which isn't bad considering its speed and resolution/color
depth. It's actually a great deal faster than most 2D accelerated
cards I've seen on PC's (2D cards, a 3D ATI Raedeon would eat it for
lunch in 3D applications).

I like using my TT. Sure, it is a bit slow, but it's usable. I
wouldn't use it for general Internet work, though. I do use it for
word processing and some scientific graphing. And I do all my image
manipulation on it since I have yet to find a PC program that works as
well as Vision, PixArt, and Gemview.

If I recall correctly (it's been sooo long since I owned an Atari Falcon030), I think there was an issue with the Falcon030's audio output. I think it was a grounding problem. The audio out wasn't grounded properly or something like that. I think soldering a grounding wire to the outer part of the plug (internally) and the metal RF shielding (or another ground point) solved the problem.

Don't quote me on that, however... I just remember hearing/reading something about it back then... and I *think* that was the solution. But I could be wrong. Make sure you research the issue thoroughly before commiting to any physical modifications. I know I would.

>What's wrong, and is there a way to fix this?
>

If it's only happening on some games and not others I would suspect the speakers are the problem, the other two replies I have seen mention possible grounding and connection problems, however if either of these were the case I would expect the problems to show up all the time and not be limited to a specific program.

I think the problem is that these games are producing audio containing frequencies beyond the range of the speakers and the "crackling" may be the speakers best attempts at recreating those frequencies.
Speakers with two cones (Mid/Bass and Tweeter) will provided better sound than single cone units and remember that the accecpted full audio range is 20Hz to 22KHz, and while the Falcon should be able to produce these a lot of PC speakers only opperate in the 100Hz to 15KHz ranges.

There are several ways you could try to confirm that speaker responce in the problem...
1) If the audio output is in Mono and being sent to both speaker then they should both be crackling.

2) Try those games with a better pair of speakers, if you can't borrow any then you could use a good pair of headphones or try running the sound through the Falcons internal speaker. If the crackling disappears or becomes less noticable on your headphones, or persists with the Falcons internal speaker it's probably the speakers as I doubt the internal speaker has a better response than your external ones.

One more thing to consider is, is it a crackling you can hear or more like a rattle/buzzing if the latter it could be either a torn speaker cone or that your overdiving the speakers.

Actualy, I recall Dynacad showing up on the cover of several magazines when the TT came up, as one of the first software that was upgraded to support TT-specific features. Although I never tried it, I would guess that it support TT-high.

(Hallvard Tangeraas) writes:

>So you're using a floppy-only system?

Yes and only the internal floppy at that. I suppose I should get an additional floppy to use for the song data discs and leave the program disc in the other permanently.

I kind of like the idea of having a lot of floppies for the song data because if everything were to be on one harddisc and it went down I would be screwed. I have as many as 10 projects going simultaneously which might be using midi tracks.

>Have you downloaded the latest version of Creator (in case you don't already have it to begin with)?
>Download it from the Notator website and copy it over to a freshly
>formatted floppy to ensure that no viruses or anything else is causing problems.

Great! My version is very old. I'll be excited to try a newer version. Excuse my ignorance about all this. I only recently discovered that there is this thriving Atari community and availability of parts and programs. It great!

>Are other programs also behaving in the same way, or is it just Creator?

Well this computer gets used exclusively for Creator so I dont know. I've never really used it for another program believe it or not. I do everything else on my PC.

>Have you tried it on another machine?

No.
The sluggishness I'm talking about is not really eggregious, just annoying. It wouldnt suprise me if its just the way the program works. I have noticed that upon executing certain commands the cursor will flash off and on quickly to indicate that its working and during that time the program will apparently not accept another command. Were talking about a fraction of a second but over the course of a 6 hour session it can get annoying. All things considered I'm actually quite happy with the system and surprised that it has continued to serve me for 15 years.

Thanks,
Garth

I downloaded it but I am using a PC for internet access so I had to format the floppy for the PC of course. I didnt think it would even read in the Atari but it does recognize the disc. It shows two icons, both are folders I think (as apposed to a program icon). One says "ac." and the other says "creat_31.zip". Neither of them will load. They say they can be printed or displayed only. What did I do wrong?

Well...STEEM is the only Windows Emulator that can do MIDI, BUT,
recreating the DONGLE on Notator is near impossable as those guys at
C-LAB were clever and made it near impossable to crack the code. You
cannot just take a disc image of it either.This has been discussed on
the Steem List as well as Hallvards Notator list
(http://www.notator.org) DARN!!!

However...STEEM runs fine with most other Atari-MIDI programs. Check
out my site for those.I also have a Steem page with installation
instructions and the Link to the official Steem site for the download.
There are many Steem users on the Atari-Midi forum.*see my site for
this as well

G>load. They say they can be printed or displayed only. What did I do
G>wrong?

Ah, back to the basics :-)

those are packed files. Unpack them on your PC using winzip or pkunzip.

This should result in some files (perhaps located in some folder), which might
even contain some readme file. Follow the instructions therein (if any) or just
copy the files to an atari-compatible floppy and try again.

No- these monitors are designed to be used at their full screen
dimensions. Adjusting it back out to the edges will NOT damage the
monitor in any way.

It doesn't take any more voltage to switch the electron gun on at the
edges than it does to switch it on 3/4 of an inch from the edge. It's
just a matter of timing.

Atari specifically adjusted the monitors down to achieve the "aspect
ratio" they needed to make the software designed for monochrome
applications (such as DTP) display correctly.

At the "default" adjustment, with wide black bars on the borders, a
circle drawn in Atari BASIC or by one of the DTP programs will be
perfectly round.

After you adjust the screen edges back out to the "normal" monitor
settings, a circle will no longer be round,but will be elongated in
the vertical direction.

If you don't do anything requiring the Atari aspect ratio, there's no
reason not to adjust the screen to give you the maximum width and
height. That was one of the first things I did to my SM-124 and it
worked just fine for years.

As was mentioned,there is a "notorious" capacitor which tends to dry
out and blow. Consider the age of your monitor, and blame that as
the causative factor here, not your adjustment.

: performance enough to avoid lag between mouse clicks and command execution.

The 1040ST should run Notator/Creator at quite an acceptable speed. This
is one thing that I miss, now running Logic on a TT. The lags that you
speak of sound like some other sort of problem. Does it behave the same
without the MIDI cables installed? Perhaps there is a MIDI loop.
Otherwise, do check the mouse with other applications and see if any of
the same behavior continues.

Finally, unload all AUTO program and Accessories before starting Creator.
If the lags go away, then start adding them one at a time until you find
the culprit.

If you are running clean, with 1meg of Ram, Creator should run just fine.

The problem with Notator and the Dongle is that Notator checks for the Dongle each time you try to read or write from the disk. I was able to make a memory image of Notator, and load it - but if I try to load or save a song the copy protection does its thing. I wish that there was a way to use Notator without the dongle, since I have an STbook, which has no cartridge port.

4920. Porthos 1.25

Newsgroup: comp.sys.atari.st
Date: 2001-11-09 22:39:33 UTC
From: nospam@zonnet.nl
Message-ID: <FWYG7.2379$LK4.7885@zonnet-reader-1>
Source record: 40586

I downloaded the new Porthos v1.25 update on http://www.dsd.net and gave this PDF viewer a second try. The previous version wouldn't start on my MiNT/N.AES Falcon. This one does. That's better! But I can't load the manual.pdf file: It starts loading but crashes with a BUS ERROR before I can see and read it. Then I tried loading and reading some very small readme.pdf files I had somewhere. More success here. It loads faster than with Ghostscript/GEMGS but the fonts don't look just as good. Does not surprise me: for ghostscript a big folder with many fonts is installed, whereas porthos only has a fontfolder with a small number of fonts.
Bigger and more serious pdf files won't load on my 14 MB Falcon030 (yet?).

Please try 1.25 on your system and react in this newgroup and to Porthos' author

Martin.

Dyna Cadd version 2.** takes advantage of the 68030. It can import Cad
3d files as well as 3d dxf files and lots more.

Yes it uses TT High.

I never realized Cyber Sculpt wouldn't work in TT High.

Cyber Sculpt is an excellent Modeler.

There are Demos of Dyna Cadd floating around.

I would offer them to you, but I am around 3 months behind on my
promises for emailing software.

There are TT and ST demos available.

Hi Bluey,

>well how do i get it connect to my slip server over a null modem cable for
>a start?

OK, get HSMODEM in your auto folder to correct dodgy TOS handling of the serial ports. Sounds like you want to make a sort of network right? I'm not sure if STIK supports it but STinG is more network friendly. Use Xcontrol for the control panal and use serial.cpx supplied with Sting to set up speed of serial port (max is 19200 on normal ST!!). You then install Sting and edit it's config files to conenct via Slip to a certain IP AFAIK.

That's good news!

>Now, if I could find a way to lower the volume ...

OK, download an accesory called Iphigenie and place in your ACC folder or
if you run TOS chances are you can stick it on the root of your boot
drive. You then then turn on/off internal speaker and change output level
from the Falcon. You can also change a lot more!!

I wonder if I did change the aspect ratio inadvertently. I was basically just
turning pots and seeing what would happen in order to get the image out to the
edges. Could I have changed a value which would have taxed some component?

Thanks for the clarification Bob. How can I recognize which cap it is that is
the likely suspect?

Yes I back up every disk with a second. Whenever I save a song I save it on a
primary and backup disk. You're right though. I should get a hard disk.

DynaCadd does not have a modeller abilities. It is strictly a 2D or 3D
CAD program.

I should have noted that this is the registration cost of Calamus Lite plus the cost of the PDF printer driver. I don't know if the printer driver will work with SL 99, but it does NOT work with SL 98.

Hi

Got a lot of stuff to get rid of, I haven't checked what exactly I have
but if you're interested just drop me an email.

I have some 4 or 5 ST PSUs, all working and a Falcon one. I'll check to
see what voltage they output under load to see if they are working to
there specification.

I also have 4 or so floppy drives, I'll have to check which ones are good
and test them out. These are DD and I have one HD from my Falcon. I have
about 3 or so Epson DD drives but not with special front facia. Work
great, pulled from Acorn RISC machines.

I have some 40-80meg 2.5" IDE drives, again, I'd have to test them out and
sector test them under HDDriver.

External floppy drive as well which is great for games on the ST, complete
with wall wart PSU.

I have couple of STEs that could be mixed together to make a nice one as
one has broken simm sockets and I only have one working Shifter chip
between the two. They come with TOS roms, 1.6 and 1.62.

I also have tons of simms that I will get rid of, all 30 pin. Most are
1MB which would be nice for STE users to get full 4MB.

Just email me otherwis I'll have to sort this lot out and probably shove
it on ebay.

Thanks for looking,

PS, I'm in the UK so prefer UK buyers as the P&P may be more than those
parts :)

Yes, you did change the "aspect ratio" when you extended the visible
screen out to the edges, but that's only a measure of the ratio of
width to height- there's nothing "electronic" about it, it only
describes the visual presentation on the screen.

Atari purposely adjusted the screen down so the height to width ratio
was different from a "normal" computer screen, as I mentioned, to
match the display to the software.

Adjusting the screen display will not "tax" anything. It's designed
to be used full screen.

>the likely suspect?
>Garth

As Bill Freeman mentioned, it's a 2.2mfd non-polarized electrolytic
capacitor (which can be frustratingly difficult to find an exact
replacement for), but which can be substituted with a 2.2mfd Tantalum
capacitor.

Umm... as for the exact location- I have a very vague recollection
of the last time I saw the inside of my SM124, but it's not good
enough to be able to describe it.

As Bill mentioned, there used to be text files available which go into
detail about where the capacitor is located, and how to go about

replacing it. (Ironically, there are also text files explaining,
step by step how to change the width and height like you just did)

I'm not sure exactly where to start looking for these files, but some
of the Atari archive sites might have them available still.

If you look around the center of the board (my fuzzy memory seems to
be telling me), you may luck out and be able to actually see the bad
capacitor- it may be leaking or actually be "blown out" physically.
It;s a small one, probably about 1/2 inch tall, again- as I recall.

Good Luck..!

FamilyNet Newsgate

I am pleased to announce that the website devoted to all things Spectre GCR has been updated, and will receive further updates and additions as the weekend progresses (for it is a holiday weekend!).

You can find this site at...

http://www.geocities.com/clu-da-bard/spectre.html

New additions would include:

* More files and Spectre adds that were added to the download section
* More links to other Spectre references.
* Basic cleanup of the website in general.
* More links to other classic Mac clubs and sites.
* Added a software review section to say what files and OS's work and not and how well.

The Spectre GCR site would love to hear from any one with Spectre GCR experience on items not already covered on this weeksite (and that, I realize, could leave a lot open.. but we're trying to be thorough..)

Come check it out.. me know what you think!

Doctor Clu

I can't see any reason why Porthos cannot have an option to use fonts stored
on another partition, the current situation is more than a little silly.

I've copied aliases of my PS fonts into Porthos' font folder, but it hasn't
really brought any benefits to the few PDF files that I've been able to try.

Summary, it still needs some work!

Hi Jared,

>2) What about a PDA device (similar (in function) to what Palm, HP, and
>Handspring sell)? I thought that a "kid/teen" version, sporting the
>Atari fuji symbol as the shape/look of it's case, would be awesome!

Awesome? Do you really think anyone out there is waiting for a PDA with a
Fuji logo? Please stop these silly nonsense and wake up!!
As far as a kid/teen version goes: forget it, kids like to be treated as
adults, kid/teens version of a product *always* fail because the adults
are to stupid to realise this. The trick is to market a product so that
it appeals to everyone and treat the teen customers as adults. Name me
one company that has produced a kid/teen version of a successfull product
and scored big with it....

>3) What about taking MultiTOS and "amping it up" for today's technology?
>I always thought that it would be neat to improve GEM in so many ways
>that it could be renamed "GEMillenium".

But MultiTOS has been "amped up"! it's called freeMiNT now. Several people
here have told you this several times before, yet you ignore it. There's
no need to go and reinvent the wheel. Forget about "GEMillenium". the last
thing we need is another TOS compatible OS.
If I was a MiNT user I would feel offended by this continuous drivel about
an improved MultiTOS. You're insulting everyone that supports, develops and
works with MiNT..... I've been flamed here for a lot less in the past :-/

>Let's just pretend that any of this actually *could* happen and let me
>know what you think about it.

Do you really want to hear my opinion about a silly shaped PDA ? I think
not.... :-)

Cheers from Belgium
Dennis

>a standard printer. I forget some other things.
>I bought it from APAK in Paris. I don't know if it is still
>available. This soft runs only in ST monochrome high resolution.

You probably use an older version of Platon, since version 2.20 Platon
can run in 256 colours and works in any resolution, it also runs under
MagiC and MiNT now without problems.
AFAIK VHF Computer still sells Platon although the current version
needs *minimum* a 68030 with coprocessor, a 68040 is recommended, the
program occupies some 55Mb on the harddisk and the price will shock
you.... :-/

Cheers from Belgium

Yet, maybe yes. Picture heigh is to be adjusted by a trimmer-potentiometer
labelled VSIZE or similar. Picture width is to be adjusted by moving
the core in a coil. This should all be safe enough, assuming that he
takes the precaution to change the notorious 2.2uF capacitor right away,
just in case. Also, he should take precautions not to kill himself by
the high-voltage sections.

However, if he fiddled with the potentiometer which regulates the output
voltage of the power supply (and this also has the effect of changing
the picture size) he could have easily fried some component in the monitor
by overvoltage.

Cu.

Hi Bill,

>The Magic Mac demo instructions are only in German, and the demo is so
>crippled that I can't tell for sure if it will do what I need it for.
>I did contact Bengy. He only has MagicMac v 6.1,(not the latest
>version) and it's in German.

MagiCMac 6.1 is the latest version, to transform it into 6.2 you need to download the patch from the ASH webside and patch it yourself. The last official English version was 6.01 distributed by Atari Workshop. If you have experience working with MagiC, then the problem of a German MagiC-Mac can be fixed in no time. But if you never used MagiC before then it might not be so easy.

>It's unclear if the version he sells comes with NVDI.

NVDI is not included with MagiCMac or any other version of MagiC and in case you were not aware of it neither is Jinnee.

>Nobody seems to sell a version with english instructions, and I don't
>have time to learn German just so I can spend $150 for a piece of
>software that may not be an adequate substitute for my TT.

I agree that it isn't exactly cheap, but it all depends on what you plan to do with it really. For someone using it occasionally it certainly is a costly affair, for someone using it all the time it's a bargain....

>ASH is a lot like Atari corp, they don't care if anybody buys it or
>not.

ASH is the main distributor for Germany and Austria. And that's where the problem begins, the distribution of the English versions has been licenced to Atari Workshop (formerly System Solutions). Atari Workshop is the sole distributor of English ASH software, so all requests and complaints should be addressed to them.
The only way to get them to update and release version 6.10/6.20 is by demanding it. If enough people show interest in the latest version, no doubt it will follow, and although I haven't got a clue I suspect that given the exclusive licence ASH can't even sell you a English copy but will refer you to the English distributor. It's the English distributor that is responsible for the translation and the manual, ASH hasn't got anything to do with these...
I realise that all this doesn't solve your problem, from your previous posting I got the impression that you use rather old software and have

never used MagiC before. Especially older software doesn't like MagiC,
if it doesn't run under MagiC it will not run under MagiCMac either. So
unless you can get hold of MagiC for Atari and test the apps you want
to run, then spending a lot of money on MagiCMac is quite a gamble...

Which brings us back where we started: :-)
Upgrading a TT with a graphic card and some extra RAM, will give you a
boost in performance which might be acceptable to keep on using it for
another couple of years...

>>Any Atari is capable of accessing internet just fine, so there's no
>>need to start messing about with floppies.
>
>It's not ridiculous to me, because even my TT with CAB and Sting is
>inadequate for accessing many, and maybe most present day internet
>sites. So if I want to access a site using Java or Flash and other
>similar stuff or have SSL so I can purchase something over the internet

IKWYM... but as a Atari user I mainly visit Atari related websites and
these usally are accessible with CAB. And there is more in life then
just surfing.... email, usenet, irc, icq, telnet etc are just as good on
the Atari as on a PC, one doesn't have to worry about receiving some
nasty viruses either. I have always managed to buy whatever I like over
internet. If a site insists on SSL encryption I get in touch with them by
email, and no doubt a posting will soon appear here informing us that SSL
is possible with a CAB OVL file for MiNTNet.

>I'm going to have to buy a PC because I'm an engineer, and 90+ % of the
>companies I deal with use Autocad which is only available for a PC. Even
>though I have Vectorworks for my Mac which claims Autocad compatibility,

>it's not completely compatible. I can futz around and manage to convert
>and read their Autocad drawings, but I can't expect them to screw around
>trying to read my drawings on their PC.

I can't really think of a reply against those arguments except asking you
why this would have to mean the end of the TT? I've seen people move to
the PC just to be able to work with MS Office...
During workhours I'm confronted with PC's all day long, when I get home I
don't want to hear or see anything that even resembles a PC. In my own
private time I use what I like best, that's Atari, I call this "spending
some quality time" ... :-)
I regard a PC as a tool, a tool that is used as the means to help make a
living. But why that a majority of people insist on using that "tool" as
their private computer is beyond me. How many truckdrivers do you know
that have a truck instead of a car? Why do people want to work on the same
crap as with which they have to make their living during working hours?

Cheers from Belgium
Dennis

4954. Chaining SCSI devices

Newsgroup: comp.sys.atari.st
Date: 2001-11-10 14:03:53 UTC
From: ebaiz@skyenet.net
Message-ID: <dtaH7.46$7_.71877@newsfeed.slurp.net>
Source record: 40513

Hello all,

I was wondering if it was possible to chain SCSI devices on an Atari computer. I tried it on my Hades and it almost worked. I bought an external 3 gig SCSI hard drive to load in Mint/Mintnet. It was fine this way, but I also have a SCSI MicroTek E3 scanner. I would like to have access to both of them together at the same time. The hard drive has two 50 pin Centronics ports on the back. One is a pass-through port and the other is the regular SCSI port. The scanner has one SCSI 50-pin centronics port and some other ports. When I chain the two devices (yes, I also have a terminator device hooked up to the scanner since it is the last device in the chain), the hard drive is read fine, but the scanner is only partially read. When I do a device check using HDDriver's utility, the scanner shows up, but the brand name of the scanner is all garbled up eventhough the device is read as a scanner. ScanX will not work here. Are there any other options or do Ijust forget the whole thing for now?

Edward S. Baiz Jr.
(Gamer)

HADES 060: 256meg Ram, Yamaha CDRW Drive, 1 gig Jaz
Drive, MicroTek E3 Scanner, Mach 64 w/4meg Ram, Epson
Photo 700 printer, 56k US Robotics Modem, ICQ#91257633
PROGRAMS: Extendos Gold, Cab 2.8, ScanX, STiK2, aFTP,
Calamus SL2000, Newsie, PlayMyCD, Papyrus 8, Smurf,
Nova Driver 2.67, NVDI 5, Linux, Magic, N.AES, Geneva

I think your comment of 60 postings a day says it all. How many postings a day were there 3 years ago? Will there be any postings 3 years from now? Probably, but I think it would be a safe bet the number of postings will be far fewer than 60 a day. :-(

Steve Sweet (I think it was StevE) does have a valid point about rules and if they mean anything. But as an "entity" shrinks some rules no longer have any value, and can actually be a hindrance. What is left of such an "entity" needs to adapt and change rules and practices as necessary.

As the "active" user base continues to dwindle, does it really make sense to stick to "old" rules and prevent the various Atari users, be they vendors, users, programmers, developers, etc. from all meeting in the same place? It seems to me that if you do this, you are encouraging the remaining people with an interest in all things Atari split apart and go their own ways. Is this good for anyone interested in all things Atari?

Excellent point about the subject lines of a lot of posts. AutoDesk
(the AutoCAD people) gets more posts in a day than this group does in a
month, and so many times the subject line has absolutely nothing to do
with the topic of the message.

I would think so. I don't think people have any problems with
opinions. It the way the opinions are expressed that seems to be the
problems.

> Ive not seen any childish comments yet, some adult discussion, and lots of
> disagreement.

If there's one thing I've noticed over the years, Atari users are
definitely good at having disagreements.

> > I used to be very proud of Atari owners, but these days I'm ashamed of
> them.
>
> Hence your lax attitude to this echo.

I'm assuming that your use of "echo" refers to this newsgroup. So,
would you expand on what you mean by "lax attitude" please?

Steve, do you really enjoy trying to insult people? Because I think
that it's insulting remarks like this that generate many of the negative
comments in many of the reply posts to you.

> > There are a number of individuals in this newsgroup who should look at

My comment was not about rules, it was about behavior.

I've commented about rules in another post in this thread, hopefully you will see it.

Hi!

I am looking for a program called Saebar (or something like
that, Seabear, Saebear...) for MagiC. It was a simple but
nice utility, that created statistics of how long the computer
was used, how many times it crashed etc. and displayed that
in nice graphs. It was shareware or freeware, it was available
on the Internet, but I cannot find it now ;-(((((((((
In info window there was a picture of a bear, so maybe it
is somewhat connected with the name. It was a German program.
If anyone knows where I can download it from, please tell me.
Thanx.

I'm sure I have the repair instruction file. I'll look for it and post
it here if anyone asks for it.

The 2.2 mfd Cap isn't hard to find though. As I recall its fairly
large, maybe .75" dia and 1.5" long, and near the power supply. The
replacement has to be unpolarized, which can be hard to find in an
electrolytic. It's best to replace it with a tantalum which will
probably last much longer than an electrolytic. I mounted the tantalum
on 2" long wires, sticking up from the board, so it would have more room.

Don't forget to look at the fuse(s) too.

4965. Need help running Rogue under emulation

Newsgroup: comp.sys.atari.st
Date: 2001-11-10 19:34:46 UTC
From: Hugh Falk <hughfalk@mindspring.com>
Message-ID: <qjfH7.52621$zK1.14164536@typhoon.tampabay.rr.com>
Source record: 40530

Has anybody been able to get Epyx's Rogue to run under an emulator? I can't.

I have an original Rogue disk . However, I'm trying to use a disk image I found on the net. The game seems to run fine, but after a couple of levels you will always die and instead of your name on the tombstone it will say "Pirate, scum of the earth."

The problem is that the ST disk SEEMS easy to copy...and the game runs. But the game recognizes that the disk is not an original and kills you and calls you a pirate.

I'd like to solve this in 1 of 2 ways:

1) Ideally I want an image of Rogue that works properly with emulators. Then I can just play it under Winston or Steem. Could somebody point me to one?
2) Optionally I can use my original ST Rogue disk with an emulator. However, neither Winston nor Steem seem to support this. I remember Pacifist supporting this, but I can no longer get Pacifist to work under Window Me. Is there another Windows Me compatible emulator out there that can read ST disks from the PC drive? Does this feature even work right in Pacifist?

Please email me at: hughfalk@mindspring.com

Thanks in advance,
Hugh

4966. Re: Chaining SCSI devices

Newsgroup: comp.sys.atari.st
Date: 2001-11-10 20:21:45 UTC
From: osian@zetnet.co.uk
Message-ID: <3bed8c59$0$8560@news.zetnet.co.uk>
Source record: 40531

I can't see any reason why this shouldn't work. I've got a hard disk, CD drive, Syquest drive, Epson Scanner, and a card reader all daisy chained in this way. Aome devices don't have a second port, and so the ribbon cable I have simply has connectors at various points along its length. The scanner does have a second port though and I've used that to connect it into the chain.

Strange problems can occur with termination. I know you're always supposed to have a termination, but in one configuration of the system I had, it worked better without the terminator dongle. (But I think my chaining was wrong...). The last device in the chain is the card reader which has a selector switch with 14 positions - 7 SCSI IDs in each of terminated and unterminated, but no matter which position I put it to, it always appears as SCSI 2, and presumably terminated as everything works OK. I think I may have a faulty selector switch!

If I switch the scanner's termination on, I get write problems to the hard disk.

Your problem may be caused by incorrect termination at some point, or as someone else suggested, a faulty cable.

I've looked into those so called unlimited access doohickies but I seem to use less when I pay as I go than I would spend on an all-in unlimited account. I was going to sign one up anyway on the basis that my littleone could use the web when he visits, he's always got something he wants to check out, but my daughters just quit her job so that's another one that'll need a free feed. One I spotted in a PC mag recently offered 8AM - 5:30 access for a fiver a month, but I'd prefer to have an evening/overnight scheme. If only someone had an overnight jobbie for a 5ver

Yes, and also try it with the minimum number of AUTO folder and
START folder programs. I found my crashing was due to DOCK.APP in
my START folder - removing it cured the crashes.

I also found that in mono resolutions 5 of the icons were the
same! They are different in 16-colour and up. The author is aware
of it and hopes to have a fix for this soon.

Even if one could write a plugin to the line F in the emulator (Beware! writing Intel assembly can damage your brains!) there would be the problem that almost all existing app's confuse the the line F with the 68020/30 extended operands and instruction set. I suffered this problem when I wrote a line F <--> 68881 board software bridge for the 68000.

>Edward S. Baiz Jr.

At one time I had a Sony CD drive, Yamaha CD writer, 250M Quantum drive,
1G IBM drive & a Microtek Scanmaker on my Falcon. Main problem was some
data loss on the drives, but I think this was down to Newsie. I don't use
the hard drives any more, I found that using an IDE drive was more reliable.
I got round the problem of termination by making up a cable using IDC
connectors, this gives a long cable with multiple connectors & you don't
need pass through ports (which the drives didn't have anyway). The IDC
connectors are easily pressed onto the cable using a small vice. You could
try swapping the order in the chain, it took a bit of swapping to get all
the above working together.

4974. New MagiCNet

Newsgroup: comp.sys.atari.st
Date: 2001-11-11 03:57:53 UTC
From: Bengy <bengy@mac.com>
Message-ID: <B813454F.49A4%bengy@mac.com>
Source record: 40539

From MagiC Online
--
MagiCNet News! (Nov 10/01)
Vassilis Papathanassiou, the author of MagiCNet, sent us the following information:

"I have updated my homepage with a new version of MagiCNet (v 1.3.9b) and (finaly ;-) a dialer based on pppd but with a small GEM interface.

The new MagiCNet has now correctly functioning serial ports with MagiC 6.20 (fortunately no separate version was needed, it is now compatible from MagiC 5.xx to 6.2x).

pppd_GEM closely follows pppd v 2.3.11 for Linux and MiNTNet, this means one can use it to connect to an ISP using PAP, CHAP, m$-chap
plus whatever script an ISP might need.

It is also possible to make ppp connections to PCs running DialUp Servers both localy or through a modem."

According to Vassilis, the project is getting close to a dream come true for many users; the emulation of every stack on the Atari platform:

"I think we're quite close (to the integration of all available ATARI stacks to MagiCNet) but I need the community's help for that.

We already have glueSTiK and Draconis emulators, both ported to MagiCNet and working fine AFAIK up to now. I went a bit further and developed an I-Connect gateway which also works fine on my setup and for some betatesters. The problem is it has to be named ICONNECT.PRG (like the original) for fiffi, Emailer and other ASH apps to be able to find it. The second problem is that it has been developed by examining the library that comes with the developer documentation, otherwise no one can tell where to hook the "bridge" between I-Connect and MagiCNet calls.

So, although this project is NOT based on disassembling the original I-Connect stack, it still needs the original name and of course the internals of the C library.

I'd really like to know if there are any legal issues with this project, if yes, it should be dropped, if no, we'll have all in one, STiK/STinG, I-Connect, Draconis and some unix clients, all running _at the same time_ under one stack and every user can use the best from these worlds!"

Does anyone remember an old terminal program for the Atari ST called "Freeze Dried Terminal" (I think it was abbreviated FZDT or somesuch)? I remember using it to log on to BBS's in my local area (and not so local area, until I finally got over the "addiction" of BBSing). Ah, those were the days... when an Atari SX212 was considered fast...

>Name me one company that has produced a kid/teen version of a successfull product
>and scored big with it....

Ever heard of Cybiko? Go to their website (www.cybiko.com) and take look at their units. I was thinking of something along similar lines for the teen model of my idea... except that it "evolves" from the one function it's "born" with (there are several colors and each color is given a "starting function" (calculator, data keeper (kinda like a rolodex), game, appointment reminder, etc.)) and you can link to other units (via IR) and share one function of yours with them and aquire one of theirs (per day). This now means you have one more function and so do they. This promotes user interaction in a fun way, as well as help to aquire more features for your own unit. When you've aquired all the features from all the units, your unit is now "fully evolved" and you can send in for a gold faceplate!

You can also aquire extra features (games and more) by logging onto a special website. and downloading a feature of your choice!

Think of it as a kind of "Pokemon PDA" (grin)

The adult version is fully equipt with a full set of functions (as any normal PDA), but you can also log onto the website and download/exchange features to customize your unit to your tastes. If you don't like or want a feature you have, you can trade it for another one. Games are also available...

I don't expect many to ever accept the idea that such a device could actually succeed, but then again, have you seen how insane Steve Jobs is recently? He's trying to pitch a $400 MP3 player (the iPod... what a STUPID name!) and expects people will buy it based on it's featureset and looks. Last time he tried that, the device was called a G4 Cube... it flopped and died like a fish outta water. I expect the iPod will die an equally unpleasant death... 'cause I sure as blazes would never buy one... especially at that price.

These devices, however, would not cost anywhere near as much and are much more usable. Besides, it's something Atari never made!

Sure. You can connect up to 7 devices to the Atari, like with any other
computer that supports SCSI.

> scanner is only partially read. When I do a device check using
> HDDriver's utility, the scanner shows up, but the brand name of the
> scanner is all garbled up eventhough the device is read as a scanner.

This indicates that something is wrong with the cables or termination.
First check whether the scanner's name is correct without any other
device being connected.

> Are there any other options or do Ijust forget the whole thing for now?

No, there are no options as far as software is concerned.

I have several SCSI devices connected to my Falcon, ending in the same scanner as you, and it all works fine.

I'm not sure why you've described the ports on the back of your hard disk the way you have since either can be used to feed in our out.

On the rear of the scanner, I've connected a normal 50 pin SCSI 1 lead to the corresponding socket and plugged a MAC-style terminator into the socket to its left (looking at the back towards the front). I don't know what the socket on the other side of the Centronics connector is for.

Are you sure that you have removed any _internal_ termination from the hard drive?

I've also found Steffen Engle's SCSIDRV.PRG to be useful for my scanner, as discussed hereabouts in the past months.

Just to remind ourselves, the update to MagiC 6.20 files on the DDP website
pertain as much to MagiCMAC as they do to the Atari version, when used with the
appropriate MagiCMAC updater file from ASH - and I'll bet with MagiCPC too,
if/when it's released.

Hello,

I recently installed Magic 6.01

I have a set that boots Magic and NVDI.
When Magic boots, it goes through a reset, then comes back
into XBoot. But at this point, I am unable to use the mouse in Xboot.
I let it go (till the bar disappears) then it boots Magic and NVDI
and I see the desktop with the icons I have assigned.
Why does Magic go through a reset?

I also cannot seem to assign a program to boot in Xboot.
Seems like I have to wait for the desktop, then go to the program
that I want to use manually.
Is there a work around for this?

thank you

ken

>Please try 1.25 on your system and react in this newgroup and to Porthos' author

This version acts much the same on my Hades as did the last version.
The author stated that 1.25 will now run under N.AES, but I had already
gotten 1.0 to run under N.AES/Mint/MintNet. The manual.pdf gave me the
same results. It loads and runs under Magic, but under Mint/MintNet I
loads up in color, so it looks like a setup problem on my part which I
am looking into. Small PDF files fun fine. I loaded in a 1.2meg PDF
that had graphics and it loaded fine. I then chose a 9meg pdf with
graphics. The first page loaded in fine, but when I chose another page,
it comes up for about 1-2 seconds and then I get a runtime error and am
returned to the desktop. I have 250meg in my Hades, so it does not look
like a memory problem.

I downloaded a book in pdf form (about 900k). It loads just fine, but it looks
like the graphics do not show up. The print shows up and sometimes that
big gaps and I assume they are for the graphics. I found out if you try
to go to the next page before the present page loads, the program
hangs, but does not crash the computer.

Has anyone gotten the Thumbnail option to work? I see from looking at
the manual that you can display the thumbnails, but I cannot seem to
get them to show. It would help if we had an English manual.

Has anyone exported any images? I have the demo to Papillon. Pressing
the Shift key and holding down a mouse key brings up a box with opions
one being to export images. It then looks for the Papillon program.
When I click on the Papillon program, it loads, but nothing else
happens. I guess this happens because of the fact that it is a demo.

I am still satified with the program. Most of the PDF's work fine. It
is the because of the much bigger PDF's, that Porthos needs an
adjustment.

The scanner's works great if I connect the SCSI with the terminator to the scanner. If I go through the hard drive, then to the scanner, this is where the problem occurs. I will check out the connections and the cables involved to see if there are any problems. I will also try exchanging the order of some of the other devices I have connected (CDR drive and Jaz Drive. Thanks to everyone who gave me advice.

I have found that Rogue likes to run under Regular TOS, so try setting
your emulator to that. Under anything about regular TOS, Rogue runs,
but with problems.

My understanding of the reset is to remove TOS from RAM and to load
MagiC, which is the reason for the 2 boots.

I think that the author means that Porthos now runs with n_dlg*.prg. One doesn't need to use w_dialog anymore. It even runs with the file selector freedom. The other thing that has been fixed is that under N_AES Porthos display the scroll bar. With the previous version this wasn't the case.
I still get a runtime error whenever I load for the first time a pdf. The second time the pdf is loaded fine.

It certainly works here but I've a registrated version of Papillon. One thing however Papillon displays the image vertically mirrored. Something to mention to the programmer of Porthos.
I wonder why Papillon is needed? Why not give the user the choice which grahical application he wants to use? I'm not very font of Papillon. I prefer Photoline.
>

Porthos is a very promishing program but like you says it needs adjustments. In particular I'm not very pleased with the print results. Ghostscript perform much better when it become to print out docs.

I recently acquired an Atari Megafile 30 HDD. When I attach it to my 1040ST (which has two FDDs) via the 19-pin cable, the ST does not recognize the FDDs or the HDD on boot up. Do I need a special boot disk and/or software to configure the ST to have HDD capability? Where can I find information about this, as my manuals are vague and confusing, inferring that the ST should automatically see the HDD.

I appreciate any assistance.

Sad, but quite true. Applications assume that if you have a FPU then it
is a coprocessor to 68020/30, although it can also be a peripheral to 68000.
Still, I know of a few applications which use the peripheral FPU correctly:
DynaCADD, Turbo/Pure C, Prospero FORTRAN, a satelite tracking program
and Starball pinball game :)

Unfortunately, there are several versions of PCB and these instructions
do no apply to all of them :(... I have one in which there are no trimmers
on the left side, the sub-brightness trimmer is on the right side of the
board, next to the high-voltage block, and 2.2uF capacitor is very near
the centre of the board and it is not labelled C714 (I assume that C174 was
a mistake uin the quoted post, the schematics say C714).

This seems to important to drop, so if there is a legal problem with
using the ICONNECT name, then maybe each user could use some utility
to patch the code of his applications so that instead of ICONNECT they
look for some other name? I understand that european laws allow a user
to do more-less anything he wants with shoftware he bought, so long
as he keeps it to himself.

Yeah, use the HCP.TTP compiler.

To convert HYP file to TXT HCP Command line:
e.g. " -r -oFILE.TXT C:\PATH\FILE.HYP"

Have a read of the HCP.HYP, I think it all in there.

This is fine if you run differnet MAgic setups, but this is not the way to
do it as MAgic installs itself, so you can not select to go to a TOS or
Mint setup, or even Linux for that matter. The booter should be the first
thing to load, well, just after the hard disk driver.

In message <3BEED40F.8040908@aol.com>, metalseb59@aol.com said:

>I just wonder if there is a way to get back in ASCII form the daa
>contained in a .ST (StGuide) hypertext file. It would help me a lot !

Hi Seb!

Try reading the HCP HYP file:-) Just run HCP.TTP and type '-v' on
the command line, followed by ' -oOUTPUT.TXT' (or whatever you
want to call it) and then the name of the HYP file after a space.
HCP should have come with your ST-GUIDE bundle.

From the HCP.HYP that I translated back in 1997:

```
------------
The '-v' command displays all pages (or if specified certain
pages) in the form of an ASCII text from the hypertext specified
as the input file, or writes it into an output file specified
with -o, perhaps to be able to print it out subsequently.

Unlike -r, all the ST-Guide commands will be excluded.

Examples:

HCP -v TEST.HYP Main Hallo Index

displays the pages 'Main', 'Hello' and 'Index' from the file
TEST.HYP in the form of an ASCII text on the screen.

HCP -v TEST.HYP

displays all the pages of the file TEST.HYP in the form of an ASCII
text on the screen.

HCP -v -oOUTPUT.TXT TEST.HYP

writes all pages from the file TEST.HYP in the form of an ASCII
text into the file OUTPUT.TXT.

------------

ALTERNATIVELY, if you want to see all the ST-Guide commands as
well, use -r instead of -v:

-------------
The command '-r' reconstructs a specified hypertext file to source code
in ASCII format, with any images it contains output to separate files.
All the ST-Guide commands are incorporated in the source text once
more, which makes it an ideal way for beginners to learn how other
```

people put together hypertexts. The source can be edited and compiled
afresh after making any desired (or no) changes to the source text.

If no output file has been specified with -o, then output will be to
the screen.

Examples:

HCP -r TEST.HYP

displays all the pages from the file TEST.HYP on the screen with
all the commands it contains.

HCP -r -oOUTPUT.TXT TEST.HYP

writes all the pages from the file TEST.HYP in the form of a
hypertext source text into the file OUTPUT.TXT.

HTH

However, after looking closely, I am sadly disappointed to see that this game looks to only be made for the Playstation 2. No Xbox or PC version in sight. Hmmph. Same goes for the MX racing game... but it doesn't look half as exciting (or graphically impressive) as Splashdown.

Maybe I am a bit premature in my jubilation... afterall, I've already seen Transworld Surf for the Xbox and am not that impressed with it. I'd much rather play Splashdown... on the PC or Xbox.

Let me make it a little clearer. This info is for Chassis No.: MT-9 . Since the original poster is the US I would assume that he is using this model. Which was made by Goldstar. All the 30 SM124 monitors that I have owned and the 5 that I still own are the MT-9. The 2.2mfd cap on all of them is located as I described. This information was taken from my Atari SM`124 service manual. The location is C714 dont know where you see someone posted C174. The 220v version of the SM124 maybe a diffenrent layout but were talking about a 110v version.

Oh, yes! But, I'm not sure if I really want to sell them, if I did I'd want to sell all 4 (all matching). I guess I have no need for them, send me an email and we could work something out. It's just that from recent trends old RAM is actually going up in price!

IIRC, these are PLCC sockets. If you look on the socket you notice some gaps in the corners. Prise one corner up half a mm then repeat on the oppsite side. Keep on wiggling it up slowy and soon it pops out. I do recommend a proper tool if you want to make this a habit.

Maybe the reason is that the cables are too long. I always had to
switch between CD-Writer and Scanner because when they both were
in the chain there were problems. Some weeks ago I found a very
short cable and since then both devices are in the chain without
problems.

AFAIK it has to do with the placement of XBoot in your
autofolder: if you put it after Magxboot it won't come
'back' for a second time.

Does the hard drive have any internal active termination?

If so, it should be switched or jumpered OFF.

If the drive was working by itself as the last device in the chain,
did you have an external terminator on the 25 pin pass through socket?

If not, how was it terminated?

I checked it yesterday with a pair of headphones, and discovered that the
sound was fine. So I guess it was the speakers I were using that were
causing the problem.

Now, if I could find a way to lower the volume ...

Thanks for replying.

Hi all,

I need pictures from the Atari laser printer SLM 605 and 804 for my
homepage. I make a web gallery over the atari hardware.
Maybe somebody have pictures from the Atari SMM 804 needle matrix
printer. (or was this a thermo printer?)

I need also pictures from other Atari hardware like the floppy drives
SF354/SF314, the monitors SM144/SM146, SC1424 and the external hard
disks from the Megafile (and SH 204) type.

I hope, anybody can help me and send me the pictures?
JPEG is the best format.

Thanx to all.

Ciao, Bernd

X-Boot was written by TEN software, according to my manual. In the US,
the distributor was Gribnif software at http://www4.pair.com/gribnif/.
You could email Dan Wilga there and see if he can answer your question
about ownership of the code.

This is very true. In the heady days of GEnie when Atari had an
official online location, anyone who started flaming someone was
promptly "kicked out" and not allowed to participate. That's one of the
advantages of the old pay services, you could enforce rules like this.

Sounds like its looking for a PC version of the Standard Library.
You have tried a compiling a simple "hello world" program.
Also unless you are stuck with floppies you would probably be
better off with GNU C. There are some fundamental problems
with the Optimiser in Sozobon, which as far as I know were never fixed..

I have overcome this problem with the use of an AUTOEXEC.BAT file in the Auto folder. The problem is that I can't remember the details of how I did it - someone better informed than me told me at the time. I think I have simply listed the PRGs I want loaded (which does not include XBOOT) and MagiC reads this file. I have XBOOT as the second programme in my Auto folder, before MAGXBOOT.

I can select a set in XBOOT which will load MagiC and then it loads without going into XBOOT again, so it can be done.

Cheers

Paul

Yes, you need driver software, such as AHDI or HDDriver. There should
have been a disk with the Megafile with AHDI on it. HDDriver is
commercial, still available, and still supported. AHDI is available
from different places, do a search on the net if someone else doesn't
tell you where you can find it.

There is a CPX - FSOUND.CPX - that allows you to set the volume as
well as the L/R balance. I believe it works on the 3.5mm output as
well as a built-in speaker.

Hi David

| You may find some good pictures on ebay. Ask the seller for their
| permission to us the picture of the Atari stuff they have for sale, to
| use on your web page.

The images on there wont be the property of the posters but are still the property of the owners of the designs, i.e. Atari, so if any permission is needed it will be from the owners. This would be a bit of a grey area so i suppose it would be alright to use them and state all designs and logos are (c) Atari inc.

I think you are probably out of luck. The website for DynaCADD no
longer lists anything for CAD at all, not even the Windows version.

I actually talked to the original programmer of DynaCADD years ago,
after the move to Windows. He hadn't looked at the Atari code in years.

You've nothing to lose by trying, tho'.

Hi Ctirad,
As a consumer, let me add that it would be really nice if patch
programs were'nt needed from the get-go and I assume from your ideas above
that programs like BackwardIII would also not be needed. Also not
desirable is the need for hardware changes to make audio outputs work well
nor stable connectors to be added in place of those that were put in to
save a lousy millimeter of space!

As you've done, just list the programs in the order you'd like them to run.
MagiC's MCMD.TOS will then run them in turn.

>I can select a set in XBOOT which will load MagiC and then it loads
>without going into XBOOT again, so it can be done.

It's easy to get into a mess - you should really have XBOOT as the FIRST
program, so that you can load a non-MagiC setup. I've set XBoot to autorun a
default set unless a key is pushed.

Needless to say, this isn't really compatible with the autoexec.bat approach.

OK, download XControl which is an accessory, just place the
xcontrol.acc in the root of your boot drive. Then you use files that
have the CPX extension like FSOUND.CPX with XControl. Usually you
make a folder called CPX or something on your boot drive and store all
your CPXs there.

Hello,

I have alittle program that I found that goes in the auto folder. When
run, it skips Xboot while Magic is booting, so that Xboot only comes up
once in the booting process...

Hello,

Actually the original cable that I use is about 6 feet, then I have a 3
foot cable that I am using to connect the scanner and the hard drive.
The length could be the problem, but I need the 6 foot cable because of
the way my system is. I will check into that...

>way you have since either can be used to feed in our out.

I tried switching the ports and found out something interesting. When
switched, both names were garbled. This leads me to think that
something is wrong with the ports. Maybe a bad connection somewhere? I
only paid $30 for it on Ebay, so it is no big loss.

>Are you sure that you have removed any _internal_ termination from the hard
>drive?

I am sure that it is not terminated as it will not work unless the
terminator device is not used (when the scanner is not being used at
the same time. When the scanner is connected and is the last in the
chain, it needs the terminator while the hard drive does not).

>I've also found Steffen Engle's SCSIDRV.PRG to be useful for my scanner, as
>discussed hereabouts in the past months.

Where can I get a copy? It would not hurt to try it out.

I do not think it has any internal termination as it needs the external terminator in order for it to work. I will check though. It did not come with a manual as I picked it up on Ebay for only $30.

I think you'll find its the other way around, skips Xboot once magic has
loaded.

MAGIC_XB isn't it??, there's also a version for users of TUBS, another boot
selector I believe. This information taken from the CD-mag Revolution
may/june 1997

Hi All:

I have a question

Is the software on the ST format discs considered Public Domain?

For example: Steinberg released their MIDI program TWELVE on an ST
format disc.
Can this now be considered Public Domain that I can have the program
as a download on my site?

Just want the REAL LEGAL STUFF here, as I try to do things by the book
on my site.

Thanks!

Yup, I moved to FzDT after starting with Vanterm, but it couldn't handle modem 2 when I moved to a MSTe and wouldn't go above 19k2 either... a pity.

I think I ended up with Teddy Term - except that couldn't handle the graphics card. The Semper/LED combo was a relief in the end (cryptic as it may have been...)

I use MagiC, NVDI and XBoot. Magic does a reboot in order to install itself, so that's perfectly normal. Place MagxBoot before XBoot to prevent going through XBoot twice.

I don't have a problem with using the mouse in XBoot. What might you have in the Auto folder that may be affecting this? Take a look at the unsorted Auto folder to get a clue.

Again, there shouldn't be a problem here.
Were you using Magic before? What program did you want to autostart?

We are a non-profit computer recycling center.

http://www.aftermathtechnologies.com

We have a veritable cornucopia of computer odds and ends.

Macintosh product:
500's, 7600's, 8500's, Motorola Starmax 3000/180's, Powerbook 1XX
models. Each only $20.

Mainframes:
SGI Power Series, Onyx, MIPS RC6280, HP servers, Compaq Proliants,
Compaq SCSI-2 RAIDs

Vintage computers:
Sharp PC-5000 laptops new in the box! ($250) Bubble Memory too!
Apple IIc, Apple IIe, C64, tons of TRS-80's (model III and IV) All
only $20 each.
Powerbook 100's ($100)
Atari ST Mice $5 each! All new!

All our prices are negotiable. post in our forums, or email us for a
purchase. All proceeds go to fund our computer placement programs. We
place ONLY Linux PC's (over 50,000 a year) with underprivlidged
families and 3rd world nations. Come by and check us out!

Hi Tim,

> Is the software on the ST format discs considered Public Domain?
>

There is no general rule for this. Some were PD and some not. But exclusive
full versions are in most cases not PD.
If it's a full version of Twelve I doubt that it's PD.

Greetings,
Matthias

Hi,
I tried this when I first set up.
I cannot recall everything, but I think that I was having troubles
loading NVDI after MAGIC. NVDI kept prompting me for WDIALOG,
eventhough MAGIC was installed.

Another reason, is that I still may want to access programs through
TOS. Well, why would I want to do that?
Because I created a music file through LOGIC under TOS.
When I called up the file in MAGIC, it was gibbrish.
This file is hours of inputting. So in order to complete my work,
it will probably have to be finished under TOS.

But MAGIC and NVDI definetly speed up LOGIC.
Unfortunately, some of the menus in LOGIC are double images.
I haven't quite figured that out yet.
The Notator 3.21 Docs say to enable GEMDOS-text, mouse acceleration,
and Line A. Everything else should be disabled. (NVDI's configuration)
So I may try disabling GDOS in NVDI's configuration.

thanks

ken

Hello,

The AUTOEXEC.BAT file sounds interesting.
My NVDI manual says that: With MagiC (version 4 or later) you can fix
the sequence of AUTO folder programs in the file AUTOEXEC.BAT
My MagiC manual doesn't say anything about an AUTOEXEC.BAT file.

Can you give me an example of how you call in a program?

thanks

ken

Hi,
Yes, that is what it says in the NVDI manual. But I may still have
to use TOS to finish old work.

> I don't have a problem with using the mouse in XBoot. What might you
> have in the Auto folder that may be affecting this? Take a look at the
> unsorted Auto folder to get a clue.

There is nothing unusual in the Auto folder. The only thing I could
think of would be Atari's mouse accelerator.
Should I disable this and just use NVDI's mouse accelerator?
Because, the Atari mouse accelerator is working in conjunction
with NVDI's. But I am not sure if this is the correct way.
Another strange thing. When I call up the Mouse Accelerators CPX
via COPS, the CPX is in German. I ordered English program, English manual.
I also use The Best Trackball.

> > I also cannot seem to assign a program to boot in Xboot.

No, I was not using MagiC before. Just TOS with HDdriver.
I would like to autostart LOGIC, FLASHII, ATARIWORKS.

thank you

ken

5065. CAB v2.7 question

Newsgroup: comp.sys.atari.st
Date: 2001-11-14 04:27:52 UTC

Source record: 40432

Hi again,

I have CAB 2.7
The manual says that I need STiK. This did not come with the program.

I seem to recall a program called STiG. (I am not sure if I have the
correct name)

Which one is better to use with CAB 2.7?
And Where can I find?

thank you

Stik (ST Internet Kit) is the TCP/IP stack and dialler for use with
Internet clients. It is available at http://www.flinny.demon.co.uk/,
however Stik is rather out of date now.

The developers split up at some point and the result is that we have Stik2
and Sting (ST Internet Next Generation). Stik2 is available at the site
mentioned above, Sting was at http://www.stud.uni-hannover.de/~perot I
think but that site is no longer there.

I use Sting and find it very good and reliable.

I think Teddy Term came out around about this time, which better fitted the
GEM environment, although it too fell by the wayside.

These days Connect is the one to go for.

>I tried switching the ports and found out something interesting. When
>switched, both names were garbled. This leads me to think that
>something is wrong with the ports. Maybe a bad connection somewhere? I

That's bizarre, because if you open the case you will find that the two sockets are connected together with a ribbon cable, the middle of which will have an IDC connector to plug in the back of the drive itself.

>only paid $30 for it on Ebay, so it is no big loss.

Are you sure that no-one had "fettled" the drive before you had it? Sounds like it's a good time to ply the screwdriver and take a look at this and make sure that there's no termination in place on the drive PCB.

>I am sure that it is not terminated as it will not work unless the
>terminator device is not used (when the scanner is not being used at
>the same time. When the scanner is connected and is the last in the
>chain, it needs the terminator while the hard drive does not).

I'm very confused by that paragraph Edward ;-)

It looks like you've got a double negative in that paragraph, which leads me to think that your SCSI drive is indeed internally terminated. Either that, or the other explanation might be that you need to set the drive to provide TERMPWR to an external terminator (you'll need to look up the drive on the net to get the details on how to do this). I've found that it helps to set all, or as many devices as you can, SCSI devices on the bus to do this.

>>I've also found Steffen Engle's SCSIDRV.PRG to be useful for my scanner, as
>>discussed hereabouts in the past months.
>
>Where can I get a copy? It would not hurt to try it out.

It's part of the GEMAR 3 archive, I don't have a URL but it's easy to find with Google. Shout in email if you can't find it.

>I have CAB 2.7
>The manual says that I need STiK. This did not come with the program.

CAB comes with IConnect, AKA PPP Connect. It's a MagiC-only stack/dialler, and the CAB.OVL that comes in the CAB archive is meant to be used with this setup only.

If you want to use STiK instead you can download it from http://www.netset.com/~baldrick/ , not forgetting to grab the dialler and the CAB overlay (get the latest versions of all).

>I seem to recall a program called STiG. (I am not sure if I have the
>correct name)

STinG. Get this from http://www.ettnet.se/~dlanor/index_nc.htm

You can use the same overlay from the first URL, and there is an alternative overlay that you can use for STiK or STinG from http://obooklage.free.fr/

>Which one is better to use with CAB 2.7?

IConnect is much easier to set up but locks you into using its clients, STiK is the next easier and STinG the hardest. What you lose in ease of setting up (with STiNG) you gain in the ability to network with other computers.

My advice would be to go with STiK, there are plenty of clients out there.

>And Where can I find?

You should be OK with the URLs I've given.

Well, in my last message I discussed about what I discovered about links in MagiCMac, now I had a look at MagiCPC and sadly I can only say one thing: links do not work.

Shortcuts created in windows are seen as *.lnk files, creating symlinks in MagiCPC gives an error, copying existing links gives zero-length files.

I could only try MagiCPC 6.00 29-06-1998 but I suspect this is true for any version, can you help ?

Ciao, *Mike* mikenews@triesterivista.it www.triesterivista.it

Well in my opinin, yes and no. Sometimes when various companies had
their programs listed in ST Format, they would register them to ST
Format users. When you click on the INFO option it would say registered
to ST Format.

I use STiK2 with Cab 2.8. That is the program you should use. You an
download it and the dialer for free at:

http://www.netset.com/~baldrick/stik2.html

STing is another you program you can use. It is much harder to setup
than STiK2, but it does the job well. You can get it at:

>devices as you can, SCSI devices on the bus to do this.

I believe you are correct. I plugged the SCSI Centronics cable into the
top Cent. port on the drive and it worked fine. This of course was
without the terminator device. However, when I used the bottom port on
the drive, the drive did not work and the name was garbled (when I did
a device check using HDDriver utilities program). Just where is the
intertnal terminator device. I would guess it would be a jumper.

AFAIK you should have IConnect with CAB 2.7, which works only with
MagiC and connects you to the internet.

> I seem to recall a program called STiG. (I am not sure if I have the
> correct name)
>
> Which one is better to use with CAB 2.7?

Some people say STiK is better, some that STinG. And some would
say MiNT-Net, but it is impossible to set up :P
I am using CAB 2.7 with STiNG and I am quite happy with it.

> And Where can I find?

http://sting.atari.org/

or somewhere on ftp://chapelie.rma.ac.be/atari/ in Internet folder.
Note that to use CAB with STinG or STiK you would also need
a STiK compatible CAB.OVL file that should be placed in MODULES folder,
you will find it at ftp://chapelie.rma.ac.be/atari/internet/cabovl/.

The CAB.OVL file you got with your version of CAB cannot be used with
STiK/STinG. It is only for Iconnect.

5085. Ataris @ The Alternative Party

Newsgroup: comp.sys.atari.st
Date: 2001-11-14 18:08:49 UTC
From: Kristoffer Lawson <setok@fishpool.com>
Message-ID: <9subvh$1jhg$1@news.bbnetworks.net>
Source record: 40353

Just a quick note about the rather neat computer party we're organising:

The Alternative Party is basically about collecting a wide variety
of alternative demo platforms together into an event for people who love
machines with personality, and who are trying to create demos with them.
Previously we've seen Falcons, Amigas, C64s, a Vectrex, a Commodore
PET, a Telmac, Spectrums, UNIX workstations etc. etc. We are also combining
all of this with experimental and alternative art. Some artists who will be
playing live at the 3-day event: Pnmf!, Tero Mi¿½yri¿½nen (plays live music with
synths and a C64), Telamurska, Happo, Analogia, No I Aint.

It will take place in Helsinki, Finland from the 11th of January to the 13th.
For more information contact me or visit the website,
http://www.altparty.org/ (check the archive for an invitro from Wildfire
for the Falcon!).

In addition, we've set up an area for collecting together information about
cool machines and interesting art, or the "Alternative Wiki". Absolutely
anybody can contribute information to it by clicking "Edit Text" at the
bottom of any page, and add new pages freely. If there are people here who
would like to contribute, please do! The Alternative Wiki can be found at
http://www.altparty.org/wiki/.

Hope to see some of you there.

Hi,
I need to remove the MMU from my old TT-RAM card (CA400312, 4Mb max.)
It is socketed, in a quite wierd black socket. I tried removing
it but without any success - it didn't even move. Why? It should
be removable since it is socketed, shouldn't it? Or maybe it
is glued to the socket? Is there any way I could remove it without
desoldering the socket itself?

FamilyNet Newsgate

Goofy! :)

STiK was I believe the first that allowed CAB and other HTML applications
to be used as internet browsers. STiK meaning "ST Internet Kit" or something
like that. STiNG was an improvement over STiK, thus meaning something to the
effect of "ST Internet: Next Generation".
Never have gotton StiNG to work. STiK II was quite usable until Swbell
changed the script here in Dallas.

I believe that if you are a Magic user that Cab 2.7 comes with iConnect,
which is something I wished I had installed before my Cab disks self
destructed. :)

In all cases you will need a overlay (forget the exact name) as a go
between betwix the connection utilities (Stik, Sting) and Cab.

And as many will tell you, Cab is not the only browser on the block.

Good luck.

AHCX can do what you want with a few mouseclicks.

Load AHCX
press ALT + G
A dialogue window named KIT opens
left click in the field below the 'multiple' radio button
A fileselector opens.
select a folder
Press return
The folder name will appear in the field below the radio button
Adjust the wildcards to your preferences
Choose 1 of the 10 find strings with the mouse
press ESC to make it empty
Click on the find bitton
A scheme of the folder is displayed in a journal window
You can save the journal as text file via the menu jrnl-->Save as

Message-ID: <3bf30ea4$0$8557@news.zetnet.co.uk>
Source record: 40364

Hi Ken,

On 13 Nov 2001 21:41:58 , Ken Kosut wrote:

>The AUTOEXEC.BAT file sounds interesting.
>My NVDI manual says that: With MagiC (version 4 or later) you can fix
>the sequence of AUTO folder programs in the file AUTOEXEC.BAT
>My MagiC manual doesn't say anything about an AUTOEXEC.BAT file.
>
>Can you give me an example of how you call in a program?

My AUTOEXEC.BAT file is as follows:

```
FPU__3.PRG
NVDI.PRG
SLECTRIC.PRG
REDIRECT.PRG
SLCT_DEV.PRG
INITCHRO.PRG
DRVIN.PRG
MFP.PRG
SCC.PRG
IPRN.PRG
STING.PRG
STIK.PRG
MACCEL3.PRG
```

This looks odd at first, as it appears to load both STiK and STinG, but this is dealt with by a command in X-BOOT which renames either STiK or STinG to .PRX depending which set I boot. There is a commands section in XBOOT and mine looks like this:

```
name c:\auto\sting.prx c:\auto\sting.prg
name c:\auto\stik.prg c:\auto\stik.prx
```

or this:

```
name c:\auto\sting.prg c:\auto\sting.prx
name c:\auto\stik.prx c:\auto\stik.prg
```

which takes care or either eventuality.

BTW, my AUTO folder order is as follows:

```
FPU__3.PRG
XBOOT.PRG
EMULATOR.PRX
NVDI.PRG
```

REDIRECT.PRG
SLCT_DEV.PRG
INITCHRO.PRG
MAGXBOOT.PRX
JAR124.PRG
XMENU.PRX
STA_VDI.PRX
SLECTRIC.PRG
TOSFIX.PRG
GEMRAMH.PRX
WDIALOG.PRG
WINX.PRX
TOS2GEM.PRX
MACCEL3.PRG
DMIRROR.PRX
DRVIN.PRG
MFP.PRG
SCC.PRG
RSVX.PRG
IPRN.PRG
STIK.PRG
MINTNP.PRG
STING.PRX

I have to run FPU__3.PRG first, but then XBOOT is next with MAGXBOOT later. This seems to work well. I don't see XBOOT twice when I am booting MagiC, but I always see XBOOT after first switching on which enables me to choose a non-MagiC set if I want to - which is nearly always !

The AUTOEXEC.BAT file is between STiK and STinG, but I don't know is the position of that matters at all.

HTH

Cheers

Paul

We're back! (never really left, but had ISP issues for awhile). IF
you want to play good old classic ST online games or get a good retro-on,
heres where to do it ;) And if you have any suggestions for cool things to
do on an ST BBS, let me know. (ie: Games are not enough to make it worth
coming back to.. we need to have some more twisted retro fun..)

http://www.skeleton.org/bbsindex.html

or telnet to..

shadow.skeleton.org, login "bbs".

jeff

5105. My first recording is up!

Newsgroup: comp.sys.atari.st
Date: 2001-11-15 06:00:51 UTC
From: Daniel Dreibelbis <dreibel@sympatico.ca>
Message-ID: <dreibel-0030F0.01005115112001@news.bellglobal.com>
Source record: 40369

well, I finally went and did it!

Had the day off today, so I spent some time this afternoon and this evening working on the home studio and the apartment. And finally got up the nerve to do final mixdown of my first digital recording with Cubasis VST 2.

All things considered, I don't think I did too bad a job on this. It's certainly not as professional sounding as a good studio, but it certainly doesn't sound too bad. :)

Anyway, tonight I put together a small site using my Apple iTools/iDisk account and uploaded an MP3 version of the song to it. The only thing I'm a bit worried about is that it may have been saved in a format that only a Mac could read, although I re-downloaded it to my computer and it appeared to have read and saved it okay in the proper format without invoking Stuffit.

So it's called "May I, Mr. Beck?", a nice little blues-rocker that pays some small tribute to two of my influences, Brian May and Jeff Beck. Particularly the guitar harmonies, which I'm quite pleased with how those turned out. There's also a couple of MIDI guitar solos on it, too, but please don't hold that against me :)

I look forward to what you think, and advice on how I can improve.

http://homepage.mac.com/ddreibelbis/FileSharing1.html

BTW, the song originally started life on my Falcon a few years ago, so I think I'm pretty much on-topic :)

I give it a look. I am in the same boat. My wife also has her own business.
She is a financial consultant/accountant and does her work out of our
house. Now and then I have to use her PC. Hopefully that will stop.

He really does not have to. Just the fact that he is trying should be
good enough. I know the odds are against him, but his efforts should be
appreciated. I did the same thing in the last days of the Atari 8-bit.

No problem. There is probably more people out there who support you
than you think. Remember, even if Infogrames does not do what you want,
they are at least flashing the Atari logo which does alot for all
Atarians.

Just to warn people in the newsgroup here. I got word from a trusted friend
that you should be careful of anything you buy from these people.

He said they are "Super Jerks!" They bait and switch and nothing is as it
is described.

Just wanted to share that before someone here falls victim.

Glenn

P.S. - I did search through the pictures on their website. There was Atari
stuff pictured, but according to their message group all the Atari stuff has
been bought.

I don't have the letter anymore. I deleted it off my computer when it looked like all the efforts I put out availed little to nothing the first time around.

However, I have a more focused plan these days... but no letter has been written just yet. I'm going to put a little more background homework into my idea first, before tossing another letter off to Infogrames.

Ah, and look at this reply I got from the people who wrote Calamus...

----Email Start----
Hi Jared.

Give us a computer (what machine ever) with a current TOS version and
Calamus will run on it.
----Email End----

Now, I'm *hoping* they aren't misunderstanding what I wrote, but you tell me
if my Email was clear enough...

----Email Start----
Thanks for your prompt reply...

Now for a question:

If Atari were to make a comeback and start selling computers again
(hypothetically speaking, of course), would you be willing or able to port
Calamus to the new computers/hardware (most likely PowerPC 603e or
G3-based)?

Jared

A persistant fruitcake then ;-)
What do you hope to achieve by writing letters to a software company?
They are not in the hardware business, and the thought of going into the
business of producing hardware based on some ancient long forgotten platform
(by the majority of people, not everyone obviously) must be an amusing
proposition.

How do you explain such a business plan to your investors I wonder when your
target market probably consists of a few hundred hardcore Atari platform
users...

To me, and most people I would hazard to guess, the Atari name is synonimous
with games, not computers.
Infogrames bought the Atari name with that in mind, a theory that seems to
be strenghtened by the atari.com website and the products they are marketing
using the Atari name and logo.

Good luck anyway,

Regards,

Clockmeister.

We'll see, since I did order 2 mice from them. Should anything be awry,
I'm certain to write an expose on The Atari Times.

I can't remember the names of any of the programs I've used, but I
know there were several "Directory Lister" or "Directory Printer"
programs which would do what you want.

These all ran under TOS, not from a command line.

I'd check in the "Disk Utilities" areas in the Atari archive sites for
likely candidates.

Only positive thing I can say is you seem devoted. However, it is
obvious you know nothing of the tos platform of today, you proved that
time and time again. All talk about GEMillenium and stuff like that
clearly shows you are ignorant to the great work that actually has been
done.

You are also completely incapable of actually _REPLYING_ to postings!
Yes, you really are! You often neglect to comment facts and questions
you don't like. You also are completely incapable of correctly quoting
the message you are replying to.

I would not mind seeing the name atari stuck on computers one day, even
if I doubt it will happen (and don't think it is important), but I
surely hope you will have nothing to do with that if it actually
happens.

I have problem with PDFs, not getting more than one page. These all came
from same source though (philips semiconductors). Just sent a bug report.

>The author says that a newer version, 1.27 is coming out soon. I just
>hope people have registered this program. The author deserves support

Yes, if it doesn't bloch me from doing other stuff while it loads PDFs and
can load these philips ones (GS can't either) then I'd be happy to
register.

Hi Ed,
To a point I agree also. But when someone questions Jared or politely disagrees with him, he then insults them for their "lack of intelligence" or "laziness" when you don't immediately jump on the Jared Falvo bandwagon. In my case, asking him for his letter to Infogrammes when he originally wrote it months ago and before he deleted it (so I may review the ideas he has and possibly add my support) prooved fruitless! This can't help leading me to believe he is all talk and makes me wonder if any letter was written in the first place (and now if there was a real reply!).
If I am wrong, good! He did his best. If I am right then he is just a disruptor!!! Who knows what was in that so called letter? If it contained anything in the way he responds to people in this NG, he surely, at the very least, insulted the people at Infogrammes also! And I certainly don't want anyone thinking that all Atari enthusiasts are the same way!!! But, no proof! A 1k byte letter was too big and not important enough for him to save for supporters!!!

You don't wish to have to use your killfile or scan headers for
commercial postings, will I have to do that to avoid postings with
immature language and insults? This last posting of yours is nowhere
near the worst I've seen , but still I don't think anyone is interested
in what body parts you are comparing various usenet posters with. Could
you please stop that?

I am the first one to say Jared is clueless here, but I am extremely
fed up with your debating technique.

My advice is, if you can't prove your point by using proper language,
you should remain silent.

Regards,

Joakim

Hi Paul

| >The AUTOEXEC.BAT file sounds interesting.
| >My NVDI manual says that: With MagiC (version 4 or later) you can fix
| >the sequence of AUTO folder programs in the file AUTOEXEC.BAT
| >My MagiC manual doesn't say anything about an AUTOEXEC.BAT file.
| >
| >Can you give me an example of how you call in a program?
|
| My AUTOEXEC.BAT file is as follows:
|
| FPU__3.PRG
| NVDI.PRG
| SLECTRIC.PRG
| REDIRECT.PRG
| SLCT_DEV.PRG
| INITCHRO.PRG
| DRVIN.PRG
| MFP.PRG
| SCC.PRG
| IPRN.PRG
| STING.PRG
| STIK.PRG
| MACCEL3.PRG
|
| This looks odd at first, as it appears to load both STiK and STinG, but
| this is dealt with by a command in X-BOOT which renames either STiK or
| STinG to .PRX depending which set I boot. There is a commands section in
| XBOOT and mine looks like this:
|
| name c:\auto\sting.prx c:\auto\sting.prg
| name c:\auto\stik.prg c:\auto\stik.prx

And how does that work if you've not got xboot set to run also??.

I've also written up a tenative licensing proposition to send to Infogrames, if and/or when I get enough people to stop thinking I'm an idiot for "going against the impossible", trying to change history, or whatever and start believing that maybe my effort is just *possibly* worthwhile, if anyone would like to see it.

Not to say it WILL happen (afterall I'm not Infogrames and have no say so in their final decisions whatsoever), just that it *could* happen (if we really try our best and put our best foot forward)... and I believe that if we present a good enough image, incentive, and focus to Infogrames, it's a lot more likely than if one person stands alone.

Afterall, no team consists of just one person... and never will. Ony by projecting a strong image of our goals and direction will we have any chance to sway Infogrames in the direction we would like. Not to say that we will, but just that we could...

Let's just do a "what if":

"What if" I did manage to somehow ACTUALLY get the license for the name "Atari" and access to all pre-aquisition assets, such as schematics, chassis molds, TOS source code, etc. and we had 1 year in which to conceive of and present at least a prototype of any product(s) we decided on to seell under this "new Atari division"?

Would you:

A) Still say "Who the fuck cares. Go away!" and go on about your business.
B) Do a double take and mutter something like, "How did he DO it?"

If B), would you then:

1) Get excited and "join up" in whatever capacity you felt capable of
2) Take a "wait and see" attitude and watch to see what transpires

If 1), Do you feel you'd be most suited within or outside the division? If outside, in what capacity? If within, what position/capacity? What do you think would be a good first product to prototype/sell? How much do you think it should sell for?

If 2), may I ask: Why?

Jared

You are obviously a nice guy. ;-)
But I really was refering to the words about "sitting around as it is.. with NO
future."

One of the methods to ensure the future of your work is making it ultimately
hardware independent. :-)
Every compiler and operating system writer knows this.

I would love to have a computer that runs GEM programs 10 times faster
than my Milan.
I do not care how this is achieved. It wont be achieved by endlessly chasing
after a name.

Hi,
Does anyone out there use V-Trax for hard disk recording on the Falcon?
I'm interested in any tips that anyone could recommend in order to turn the combined tracks output into a single .wav file (other than to tape & then back in to Falcon). For example, an accessory that rips the Falcon's audio out and puts it onto disk.

If anyone has any English documentation for this program I'd be grateful.
cheers

I honestly do not remember. I haven't used Atari's hard disk software
for years. I'm using a combination of HDDriver 6.22 and 7.54, and Supra
3.21, depending on the computer.

Given the parameters stated above, I would be in group 2, taking a "wait
and see" attitude.

Why? You have not presented enough of a "goal" for me to get excited.
I would want to know more about where you want to end up, and to me your
statement in the initial paragraph indicates you want to determine that
goal within the first year. Logically, to me, you should already have
the goal of "where you want to end up" even before you make the attempt
to obtain all the necessary licenses and such.

I'm definitely -NOT- a Microsoft fan, but I think you need more than
just a new piece of hardware to sell the computer.

Hey, Gorf Maze! Um, I mean Gokmase...

You best know I'm devoted... at least when I have reason to believe that it *could* work, with enough effort.

Of course, with people like you constantly berating me for my ideas, it'll be a miracle if I ever get anywhere.

Let me ask you this... how much effort would it actually take everyone to stop attacking me and start working with me on this? Unless you simply don't care or really DON'T want it to ever happen, it seems like it should take no effort at all.

I mean, if even to just friggin' humor me, for crying out loud. Am I asking for money? No. Am I asking for hours of your time? No. All I'm asking is for people to just simply put their doubts and distain aside and imagine "what if". Toss some ideas around. Some plans and concepts.

And, if after everything is said and done... and we actually send out the proposal and either get a negative response... or none at all...

THEN, you can berate me for it all. And I will leave. Having done all that I could, with no room for doubt any longer.

But, for now, I am too inspired by the *potential* of hope to let this fall away. Oh sure, y'all can just keep trying to insult me and berate me and verbally bash me around a bit and eventually you might get me to give up.

But in the process of doing do, you may suddenly wonder... *Could* it have worked? *Could* it have been done? He seemed awfully sure of himself... and confident. And you might never know if Atari ever *could* have been revived as a company again, because you drove away the only voice willing to believe in something no one else did.

Jared
"Impossible is only to those that never try... or believe someone else who says it's impossible... or who give up before they've completed the task, ragardless how long it takes."

What exactly is this "TOS platform" you speak of? What is this "great work" you make mention of? Please educate me, so that I may stop my incessant prattle in utter ignorance of the true facts.

>You are also completely incapable of actually _REPLYING_ to postings!
>Yes, you really are! You often neglect to comment facts and questions
>you don't like. You also are completely incapable of correctly quoting
>the message you are replying to.

I am not familiar to the *absolute protocol* of replying standards. Please educate me so that I may appear less foolish in my... um, efforts to reply.

>I would not mind seeing the name atari stuck on computers one day, even
>if I doubt it will happen (and don't think it is important), but I
>surely hope you will have nothing to do with that if it actually
>happens.

"Atari" won't be stuck on just any old computers. And you can kiss the PC-compatible idea good bye, cause I ain't NEVER going down that path. No, the future lies with PowerPC and an OS that is written to handle today's users and their needs on it.

And...

If it ever happens, which I seriously doubt (at the rate I'm fending off replies like this), I believe I *will* be the one responsible for it happening... and leader of the same. And if I do cause it to happen, I will gladly forgive you for your errant attitude and permit you to join and make it all the better with YOUR ideas and input... if you qualify. :-)

Jared

Can't say many have ever been much polite about it, but that's 'cause we've all been here before since that last times I've visited with my crazy idea of restoring Atari.

> In my case, asking him for his letter to Infogrammes when he originally
>wrote it months ago and before he deleted it (so I may review the ideas he
>has and possibly add my support) prooved fruitless! This can't help
>leading me to believe he is all talk and makes me wonder if any letter was
>written in the first place (and now if there was a real reply!).

Let me say, for the last time, I hope...

I never *GOT* a reply from that letter and diskette I sent them. Believe me or don't believe me... I know what I did and where I sent it.

However, they DID reply to me a few days ago from a recent Email sent to them, in the negative (no interest). However, Baiz has seen a tiny loophole in their reply, offering just a hint of hope in an otherwise saddening Email.

Here is the reply I got:

Dear Jared,

Nancy Bushkin has referred your inquiry to me for response.

We thank you for your interest in Infogrames and in the Atari brand. Unfortunately, at the present moment we are not considering proposals of the nature you described in your email.

Please stay in touch.

Doreen Small
VP Legal & Business Affairs
Infogrames, Inc.

> If I am wrong, good! He did his best. If I am right then he is just a
>disruptor!!! Who knows what was in that so called letter? If it contained
>anything in the way he responds to people in this NG, he surely, at the
>very least, insulted the people at Infogrammes also! And I certainly don't
>want anyone thinking that all Atari enthusiasts are the same way!!! But,
>no proof! A 1k byte letter was too big and not important enough for him

>to save for supporters!!!
>John G.

Sadly, I cannot recall much, if any, of what I said in that letter. But it's a moot point. It never got a response. What matters is the response I *did* get, and a very nice, albeit slightly disheartening (but not unexpectedly so) reply from them it was!

What didn't get replied to was the followup Email I sent... and here it is:

Thank you for your prompt reply...

And now another Email from me:

May I ask, what exactly is the purpose of the "Atari" brand, if it is not a sole brand label on a product?

In other words, what weight does the name "Atari" bear when it is simply used alongside Infogrames and the actual manufacturer of the game itself?

Atari didn't program and isn't publishing Splashdown, Transworld Surf, or Transworld Snowboarding.

If Infogrames is the publisher of the title, why give any credit to "Atari" at all? What is the value of slapping another brandname on the box that really has NO relation at all to the game itself?

Surely there must be a hidden motive or reason. Are you trying to get the name "Atari" reassociated to the public in a way that will hopefully spawn enthusiasm to possibly a hardware division in the future?

If all you use (and plan to use) the name "Atari" for is to help pitch software titles published by Infogrames, that is, to me, perhaps the saddest end of a company's name ever. I call that "brandname prostitution", and I don't like it one bit.

Atari was a *company* that virtually *created* the gaming revolution. It created Pong. It created Asteroids. It created Centipede. It created Crystal Castles. It created a megaton of arcade games down through the years, not to mention a few pinball games as well. And that's just the arcade division. It also created the 2600VCS, 5200, 7800 Pro System, and Jaguar (the Lynx was actually developed by Epyx before Atari KILLED them off, from what I read) and that's just the home game systems. It also created the 400, 600XL, 800, 1200XL, 65XE, and 130XE. That's the 8-bit computers. It then created the 520ST, 1040ST, Mega ST2, Mega ST4, 1040STe, Mega STe, TT030, and Falcon030. And that's the 16/32-bit computer portion.

Let's not also forget the host of unreleased hardware. And you can add to that list the PC-clone attempt/flop, too. :-)

To take that vast lifetime of rich computing/gaming history and reduce it to nothing but an "also" name on a game title for the PlayStation 2 or Xbox...

Have you no realization of the utter loss? Atari didn't die because it made bad products. It died because it was utterly *stabbed in the back* by the very people who, a mere 10 years earlier, saved it back in '85!

Atari is NOT just a brandname. It is a COMPANY name. And the only way you will ever see it carry the kind of weight it USED to carry is to restore it as both a brandname AND a company name.

I mean, think of it... how hard (expensive) would it be to create an Atari software division that publishes titles of it's own? THAT'S where it all begins. Give "Atari" the distinction and entity it once had. And, you may well soon find out how much money you will rake in on that name alone!

As long as Atari stands alongside Infogrames, who is to know if people are buying the game based on brandname recognition (and is it Infogrames or Atari they recognize?) or just because the game looks/is fun. What is your objective?

Tossing a bunch of names onto a game title looks pretty haphazard to me and not something I would find appealing when buying the game.

I really like Splashdown and I hope it makes it's way to the PC or Xbox soon. I have no plans to buy a Playstation2.

When I went to: www.atari.com, and saw that it was back, I got really excited! Atari is back! ATARI IS BACK! And what cool game titles too!

Isn't that the kind of enthusiasm you want from brandname loyalists like me?

I like Infogrames, too. No question about that. I remember the Atari ST heyday... all those European titles for them. Ah... the memories.

Infogrames, as a brandname, has stood on it's own for years... Atari has too. But I believe the REALLY defining moment will be when Atari is the only name at the top (or bottom) of the box and sells a title based on IT'S name as a publisher, not just a "tack on" with others.

It all begins with making "Atari" a division again. Let it stand on it's own. Let games like "Splashdown" ride on the waves that "Atari" (as a brandname) and the fun and graphical "wow" of the game itself produce.

I mean, think of it for a moment... you "create" an Atari software division that publishes games for the PS2, Xbox, and PC under it's own name. You take the money from sales and keep stashing it right back into the division. From registration forms received, you notice that people bought the game mostly based on the name "Atari". Atari becomes "in" and recognized again. People really associated quality games/gaming with that name.

You then create a small hardware division. You release one or two small devices (hand-held LCD games or even possibly a Cybiko-type device). They sells like hotcakes! People buy them based on the association that Atari represents fun and entertainment!

From there... Atari begins it's comeback as a COMPANY! Selling it's own software, it's own devices... it's own games... it's own game systems...

and... it's own COMPUTERS!!!

And THAT, my friend, is how Atari is restored to it's former glory. One small step at a time. If the small step fails... you've lost little or nothing in the process. You back up and keep things the way they are.

But if the small step succeeds... and the next one succeeds... and the next... Infogrames could stand to make MILLIONS based solely on a brandname (and now a company) that was just a "tack on" brandname on a few game titles earlier.

As long as you just tack on "Atari" along with Infogrames, it shows to me that Infogrames doesn't have any real faith that the name "Atari" means enough to people/gamers to stand on it's own.

And if that's the case, then what value does "Atari" really have to you? Not a whole lot as far as I can see...

And that's the saddest thing of all...

Jared

P.S. Give me a game with the name Atari on it and I'll buy it, based on the name and the fun of the game. Give me a game system with the name Atari on it and I'll buy it. Give me a (non-Intel (or clone)) computer with the name Atari on it...and you'll have me flying all over the house like a red rubber bouncing ball shot out of a rifle!

I think you can see just how fond I am of what Atari has meant to me through the years...

Give Atari the chance to be reborn and people like me will line up around the block to buy products based on that name alone.

As to who (or how many of) those people are, you'll never know... until you risk just enough to take the first small step towards a potentially HUGE new future.

At least think about it... won't you?

Critique as you like...

Jared

Look, Jared, your heart is in the right place but you are dealing with a
huge corporate entity that won't (and cannot) make business decisions based
on emotions.

Commodore branded computers did not save Tulip from going broke, and Amiga
isn't exactly having people line up to buy the next generation whatever...
BeOS failed miserably, Apple is struggling, and god knows how many
innovative companies have gone under in the last year or so...

At the moment, asking a software company to start investing in hardware in
this economic climate is futile IMO.

Regards,

Clockmeister.

>
>My advice would be to go with STiK, there are plenty of clients out there.
>

I have tried STiK, STiNG, as well as MiNTNET.
Now I'm using MiNTNET with my FreeMiNT/SpareMiNT multitasking setup.
In single TOS I'm using STiNG together with DEVSET.PRG in my autofolder. This last
program I found somewhere on the http://obooklage.free.fr site and makes it possible
to use STiNG without needing XCONTROL and that CPX stuff.

I quite like STiK2. I used too use it a lot, and also installed it on the Atari of a friend
of mine. But suddenly my Falcon started to crash with 2 bombs during the execution of
STIK.PRG
in my autofolder. I haven't found out why. I didn't have any trouble with it in the past.
With NVDI + STIK2 in my autofolder also a message appears: "can't install AES resource"
three
times in a row. But even if STiK is my only autofolderprogram I still get 2 bombs.
What is happening here ?

5147. Atari/Amiga mess K&#65533;ln

Jared,

> What exactly is this "TOS platform" you speak of? What is this
> "great work" you make mention of? Please educate me, so that I may
> stop my incessant prattle in utter ignorance of the true facts.

TOS platform would be the platform where people are running TOS/GEM compatible software on hardware setups allowing them to do so. For native use that would include everything from STfm to Falcon and TT. Running TOS/GEM, TOS/GENEVA, MiNT/AES (sometimes refered to as MultiTOS), MagiC. You could ask for second opinions, I guess some may wish to extend it to MagiC-PC and MagiC-mac and other emulators as well.

I consider the work on MiNT to be great work, they are actually keeping the OS kernel up-to-date.

I consider the work on XaAES (a GEM-compatible freeware AES for MiNT) and N.AES (a commercial dito) to be great work, and extremely important for the future of the TOS-platform.

I consider work by programmers that stayed with their TOS-computers through the years to be extremely important. They are the ones who kept things going. They are too many to list here, but has made our machines able to play mp3:s, browse, do word processing etc.

I consider clone manufacters to have done a great job, by making new hardware, although price has kept some from getting it.

All this has been mentioned by other before, so I realize you won't understand and appreciate the importance of these things this time either.

> I am not familiar to the *absolute protocol* of replying standards.
> Please educate me so that I may appear less foolish in my... um,
> efforts to reply.

Well I can't believe you have missed some thing which have been mentioned several times. I think many would appreciate if you don't:

a) reply to your own postings
b) try to remove parts of the old posting, if that stuff is not needed for a reader to get the point c) actually try to reply to what is said in a posting (on this one you actually did ok)

> >I would not mind seeing the name atari stuck on computers one day,
> >even if I doubt it will happen (and don't think it is important),

> path.

When did I mention PC-compatible idea?

> No, the future lies with PowerPC and an OS that is written to handle
> today's users and their needs on it.

So in your mind, you need a new OS, written from scratch?

> If it ever happens, which I seriously doubt (at the rate I'm fending
> off replies like this), I believe I *will* be the one responsible for
> it happening... and leader of the same.

So you think that if the step to PPC is to be taken, you're the only
one who would be able to make it happen? Would you care to elaborate?

> And if I do cause it to happen, I
> will gladly forgive you for your errant attitude and permit you to
> join and make it all the better with YOUR ideas and input... if you
> qualify.

Oh well, how noble. I don't think I'd either qualify nor be interested.

> everyone to stop attacking me and start working with me on this?
> Unless you simply don't care or really DON'T want it to ever happen,
> it seems like it should take no effort at all.

You need to find people who believe in your ideas and are willing to support you in achieving them. To not support you and your ideas is not the same as insulting and attacking you. You also have been pretty hard on ppl who don't share your ideas and ways to see things, so you should not be surprised if some are finally losing their temper here.

> But, for now, I am too inspired by the *potential* of hope to let
> this fall away. Oh sure, y'all can just keep trying to insult me and
> berate me and verbally bash me around a bit and eventually you might
> get me to give up.

I am very sceptical about your ideas, but can't recall intentionally insulting you. What I am saying, is that I don't think you are the right man to take TOS-platform into the future.

> But in the process of doing do, you may suddenly wonder... *Could*
> it have worked? *Could* it have been done? He seemed awfully sure
> of himself... and confident. And you might never know if Atari ever
> *could* have been revived as a company again, because you drove away
> the only voice willing to believe in something no one else did.

I don't think the name Atari is the key here, as stated many times by me and others. However, if you had detailed plans to have a PPC-board adapted to run MiNT, and were trying to adapt to the reality of TOS computing of today, you might have seen a lot of positive feedback in here. Now it has been all talk about a company and its name.

Regards,

Joakim

Hello all.

(Sorry if this is off-topic here.)

My question is: Are editors these synthesizers' sounds for Atari ST
available?

1. Korg WaveStation A/D
2. Yamaha SY-35
3. Yamaha SY-99

I could even pay (VISA?), but there are no reactions to my
advertisements at home in Slovak Republic and some www I found don't
seem to support my beloved Atari for a long time.

My answer is 1... If a new computer came out under the Atari name, I
would probably buy it. However, it would have to be quite powerful
(more than my Hades060) and should run more than one platform.

Version 1.26 is *much* more stable than 1.25, and has no problems on TTs.
It is possible to open the manual pdf file ;-), and it runs happily with
MagiC 6.2, MiNT 1.16.0+N.AES 2.0.0 and even on SingleTOS (although the
toolbar looks weird then).

I'd be in group 2 because, what the hell can I do? I have no training
in hardware design, marketing, or sales.

I am a pretty good Fortran 90 programmer. But, alas, there are no
Fortran 90 compilers for the Atari platform :-(. So if someone writes
a compiler, I'd be happy to help!

I think one problem is that a great deal of Atari users are users.
Not programmers or hardware designers. So what are they supposed to
do? They are not lazy, they're just not trained in computer design.

I use an Atari computer. And as a user, if there were a new Atari
computer to use, I'd consider buying it. If that doesn't happen, I'll
be dissapointed, 'cause at some point the TT may have to leave my desk
for a faster machine.

I'll wait for the Pegasus if it actually comes out next year as
promised. Why not contact Medusa and tell them some of your ideas?
They are actually building a next-generation Atari (or so they say).
They might take you more seriously than Infogrames or some people in
this group. I bet they would like to have a liscense to print Atari
on the front of their computers 'cause it might boost sales a bit.

Source record: 40330

The full URL is this: http://www.osopinion.com/perl/story/14824.html

But, here is a small section quoted from OS Opinion on the licesning of BeOS from Palm:

Why Not?

There doesn't appear to be any specific reason why licensing the BeOS would cause Palm to lose anything, as its plans don't reside in that arena of computing. Instead, a licensing program would bring about revenue where before there was none.

It seems like a no-brainer to me. If I were Palm's CEO I'd do it in a second.

My effort to license the Atari brandname for use in a division that develops hardware is no different. Palm would profit from licensing BeOS... Infograms would profit from licensing the Atari name and access to certain assets related to it, which they have little to no interest in, plus gain profits from the division itself. "Atari" belongs to Infogrames and, therefore, any division created, by them or not. So, it only makes sense we should get what we want (Atari back as a computer and entertainment hardware company/division) while giving them something they want (mo money! mo money! mo money!) All we ask is that we be allowed to keep enough to pay our employees, keep the business running, plus expand if needed.

Oddly, no one has yet asked to see my proposal... hmm.

Jared

I'm trying to transfer a *large* number of files from an STe to a UNIX box over a serial connection and I'm having trouble. I don't want to use xmodem since I can do only one file at a time with that protocol. Using zmodem and ymodem both die after a short time transferring without rhyme nor reason (at different spots everytime).

Does anyone know if there exist any UNIX-like commands (ftp or even better, rcp) that have been ported to run under TOS or GEM ?

Or maybe someone has an alternative solution to moving my files over?

Hi Asshole

| But, here is a small section quoted from OS Opinion on the licesning of
BeOS
| from Palm:
| -------

Off topic, take it to a relevant base, with the rest of your dribble.

| Why Not?
|
| There doesn't appear to be any specific reason why licensing the BeOS
would
| cause Palm to lose anything, as its plans don't reside in that arena of
| computing. Instead, a licensing program would bring about revenue where
| before there was none.

Are you trying to kill this base as well as this platform now anus!!.

| It seems like a no-brainer to me.

Are they refering to you here.

| My effort to license the Atari brandname for use in a division that
develops
| hardware is no different. Palm would profit from licensing BeOS...
| Infograms would profit from licensing the Atari name and access to certain
| assets related to it, which they have little to no interest in, plus gain
| profits from the division itself. "Atari" belongs to Infogrames and,
| therefore, any division created, by them or not. So, it only makes sense
we
| should get what we want (Atari back as a computer and entertainment
hardware
| company/division) while giving them something they want (mo money! mo
| money! mo money!) All we ask is that we be allowed to keep enough to pay
| our employees, keep the business running, plus expand if needed.

I thought you said you'd been defeated, kindly piss off!!.

| Oddly, no one has yet asked to see my proposal... hmm.

Because we think your medication needs tweaking!!.

Source record: 40264

Hi, again

| Let's just do a "what if":

What, again, and how many more times until you get the message that we think youre an acehole who should be subjected to a painfull, slow, lingering death, and yes i'm volunteering.

| "What if" I did manage to somehow ACTUALLY get the license for the name
| "Atari" and access to all pre-aquisition assets, such as schematics, chassis
| molds, TOS source code, etc. and we had 1 year in which to conceive of and
| present at least a prototype of any product(s) we decided on to seell under
| this "new Atari division"?

I think its time i forwarded your dribble to InfoGames and requested then to shut you up legally.

| Would you:

Smash your face with a brick!!, YES PLEASE!!!

| A) Still say "Who the fuck cares. Go away!" and go on about your business.

Havent i tried this, and doesnt your nurse still let you out!!.

| B) Do a double take and mutter something like, "How did he DO it?"

I would refuse to buy it due to my knowledge of the personality of the person behind it.

| If B), would you then:
|
| 1) Get excited and "join up" in whatever capacity you felt capable of

Senior psycopath to the MD!!.

| 2) Take a "wait and see" attitude and watch to see what transpires

Atari did just that sh!thead and look what happened.

| | If 1), Do you feel you'd be most suited within or outside the division? If
| outside, in what capacity? If within, what position/capacity? What do you
| think would be a good first product to prototype/sell? How much do you
| think it should sell for?

To sell me anything that you have nothing to do with, it would have to exceed what I have now, I.e., 2Ghz processor, 512M of ram, a 80Gig hard drive, a 64Mbyte Graphics card at 400MhzFSB, that's what I run Magic PC on when I'm not playing with my real Atari.

Why look, its Jared

| Hey, Gorf Maze! Um, I mean Gokmase...

Ah!, he obviously doesnt agree with someone.

| | You best know I'm devoted... at least when I have reason to believe that
it
| *could* work, with enough effort.
|
| Of course, with people like you constantly berating me for my ideas, it'll
| be a miracle if I ever get anywhere.
|
| Let me ask you this... how much effort would it actually take everyone to
| stop attacking me and start working with me on this? Unless you simply
| don't care or really DON'T want it to ever happen, it seems like it should
| take no effort at all.
|
| I mean, if even to just friggin' humor me, for crying out loud. Am I
asking
| for money?

Yes you have.

| No. Am I asking for hours of your time?

Yes, you have.

| No. All I'm asking is for people to just simply put their doubts and
distain aside and imagine
| "what if".

OK, done that, youre still a blot on your family name.

|Toss some ideas around. Some plans and concepts.

OK, how about a TOS running, 2Ghz with 512Meg of RAM and an 80G hard drive. That's the 'current' market spec for a serious machine, how close do you plan to come to this. Can you guarantee regular upgrades of the flash-ROM or disk based OS, via the web, updated versions of all currently available software, not like the current situation of having 68000 versions crippling their 030/060 hosts, support for any available graphics card, I'd want to try my 64Mbyte@400Mhz NVIDIA graphics card and expect drivers available on the WEB, would you promise support for 5.1 sound, so that when I smash my current PC I can also use its sound card, I'm planning an upgrade to 1Gig of memory soon, so I'd also expect to be able to plug RIMMS into it as well, it would be useful to be able to plug in my dual booting hard drive and use its

NTFS partitions, could you guarantee hard disk drivers, tape drive drivers, printer drivers, scanner drivers.

Now, I want a definitive answer to each of these serious requests.

> Lyndon Amsdon

In the earlier days of the ST, when I use to repair them, they had a lot of
problems
with intermittent connections on their PLCC sockets. My first test on a
520, when
someone would bring one in, was to twist the unit--this would often bring
the unit back
to life, and I knew that I would need to go through the sockets and tighten
the connections.
To correct the problems they were having, they tried a variety of things:
clips, spacers, clips
with spacers, etc. I seem to recall, among their many attempts, the use of
a thin double-sided
adhesive strip. If this is the case, I believe that you can usually get the
chip out. I would take
a little more force than you would normally want to use, but, of course, you

don't want to crack
the socket. You may be able to use something to break down the adhesive,
such as lighter fluid,
but you will want to make sure you clean the entire area well with alcohol
afterwards. These
suggestions do have their risks associated with them. The socket should be
replaceable, if
it were to break, but it is a big desoldering/sodering job.

Good luck,
Richard Anderson

This is the easy way out for ppl who have no other way of defending
themselves - we've seen that before I think on here and are getting
fairly tired of seeing it...

>> Of course, with people like you constantly berating me for my ideas,
>> it'll be a miracle if I ever get anywhere.
>
>I believe I do have the right to have opinions here.

hmmm, what makes you think that? the fact that you have actually
done something "concrete" for the platform (hEARcoach & Aicq) rather than
spout a lot of ideas which you have no money or technical expertise to back up?

I mean best of luck to you Jared for your persistance *but* if you
seriously think that your output outweighs the contributions of active
programmers and developers here you are totally misguided. *These* are
the important ppl here as without them we would not have new apps or
hardware mods, translations etc.

>> Let me ask you this... how much effort would it actually take
>> everyone to stop attacking me and start working with me on this?

Jared, You are attacking the ppl who you need you "scheme" to work! can you
not see that? If you really are serious just get on and do something
yourself.

>I am very sceptical about your ideas, but canï¿½t recall intentionally
>insulting you. What I am saying, is that I donï¿½t think you are the
>right man to take TOS-platform into the future.

Yes, you disagreed with him!

>I donï¿½t think the name Atari is the key here, as stated many times by
>me and others. However, if you had detailed plans to have a PPC-board
>adapted to run MiNT, and were trying to adapt to the reality of TOS
>computing of today, you might have seen a lot of positive feedback in
>here. Now it has been all talk about a company and its name.

Talk is cheap, actions speak louder than words. I personally don't
have the hardware to run MiNT/XaAES to appreciate the great time and

work being put in here but these ppl seem to be the future of the platform from what I can see - whatever hardware it ends up running on eventually. I now only run atari apps under emulation but it makes no bones to me whether my machine has atari logos on it at all as long as it can run the up to date software I want to use and the OS and extensions I prefer in my system environment. This to me is _the_ most important thing. If I could run a native Atari OS (MagiC or MiNT) on available PC hardware I would be more than happy.

>
>And how does that work if you've not got xboot set to run also??.

XBOOT always runs from a cold boot, so after switiching on I can choose a
set in XBOOT with the above commands as part of the set, and also
MAGXBOOT. (Below is the set taken from the XBOOT SETS.DAT file)

#SET MagiC STiK
#DATE 2605142
#INFO1 C:\XBOOT\NEWDESK.INF
#INFO2 C:\XBOOT\ASSIGN.SYS
#COMMAND
name c:\auto\sting.prg c:\auto\sting.prx
name c:\auto\stik.prx c:\auto\stik.prg
#PRG
FPU__3
MAGXBOOT
NVDI

```
SLECTRIC
REDIRECT
INITCHRO
DRVIN
MFP
SCC
IPRN
STIK
SLCT_DEV
MACCEL3
#ACC
MAXIFILE
HADES_B3
XCONTROL
ST-GUIDE
QDIALER
#CPX
BUBGEM_E
COLOR
COOKIES
GENERAL
HDDRCONF
IPRN
KEYBOARD
KONFIG
MOUSE
NCACHE
NPRNCONF
NVDICONF
SERIAL
SI
WCOLOURS
TSLICE
MACCEL
#ENDSET
```

XBOOT then loads this set, which reads the AUTOEXEC.BAT file and loads the required PRGS but without XBOOT. (Thinking about it, I suppose this set could be much simpler as the AUTOEXEC.BAT file does the loading anyway, but as it ain't broke I'll leave it !)

After this, a re-start re-loads MagiC without XBOOT appearing, but a cold boot brings in XBOOT.

It all seems to work OK.

Cheers

Paul

| proposal and either get a negative response... or none at all...
|
| THEN, you can berate me for it all. And I will leave. Having done
all
| that I could, with no room for doubt any longer.
| . . . .

There has a lot been said (not much done admittedly) and you have been getting largely negative responses. So what is the problem? Why don't you stop?

You mentioned getting all the moulds etc that used to belong to Atari. That is of no use. If you want an ST you can buy one now. If you want something bigger and faster there is the Hades, Milan etc. What then? People buy for function - they will ask themselves, what can I do with this thing? - and compared with what is functional elsewhere, the answer must be a certain amount but a heck of a lot less than can be down with a peecee.

If you have hordes of people thinking they can make money from your machine by writing an OCR program, a speech recognition program, a whatever program, then you are flying. But if you don't then you aren't. And you don't at the moment, and you won't in the future.

You are like someone who is trying to revive the production of the Model T Ford. I can understand an enthusiast wanting to promote his hobby; I can understand him wanting to continue to have spare parts available so that he can run his car; but I can't understand a prolonged effort to revive the Model T production in the expectation that everyone will suddenly switch to the Model T from their modern air-conditioned luxurious saloon.

There is a saying round here: "Give my head peace." I commend it to you.

Hey, Bengy...

Thanks for your vote of support. It makes me feel a little better knowing that not everyone thinks I'm a blithering idiot for being so adamant about this.

Jared

Sure, but what I said goes both ways. Pay attention to what people are telling you, at times you seem to simply disregard valid points that they have. If you want your valid points to be acknowledged, you have to start by showing that you are not immune to realizing certain truths.

>used alongside Infogrames and the actual manufacturer of the game itself?
>

Using a name that is more known = more exposure = more sales!
Smart move in my opinion! Also, it could'nt have cost them much to buy an
innactive company's name!

>Atari didn't program and isn't publishing Splashdown, Transworld Surf, or
>Transworld Snowboarding.
>
>If Infogrames is the publisher of the title, why give any credit to "Atari"
>at all?

Why not? They ARE Atari!

> What is the value of slapping another brandname on the box that
>really has NO relation at all to the game itself?
>
>Surely there must be a hidden motive or reason.

Hidden? I think they are open about it!

>Are you trying to get the
>name "Atari" reassociated to the public in a way that will hopefully spawn
>enthusiasm to possibly a hardware division in the future?
>

Vale implication!

>If all you use (and plan to use) the name "Atari" for is to help pitch
>software titles published by Infogrames, that is, to me, perhaps the saddest
>end of a company's name ever. I call that "brandname prostitution", and I
>don't like it one bit.
>

There you go! True or not, that's insulting! If I were at Infogrammes
reading that I'd easily click delete and block any further E-mails from
you and not finish reading this one!

>Atari was a *company* that virtually *created* the gaming revolution. It
>created Pong. It created Asteroids. It created Centipede. It created
>Crystal Castles. It created a megaton of arcade games down through the
>years, not to mention a few pinball games as well. And that's just the
>arcade division. It also created the 2600VCS, 5200, 7800 Pro System, and

>
>To take that vast lifetime of rich computing/gaming history and reduce it to
>nothing but an "also" name on a game title for the PlayStation 2 or Xbox...
>

Infogrammes has'nt reduced anything. "Atari" was already gone!

>Have you no realization of the utter loss? Atari didn't die because it made
>bad products. It died because it was utterly *stabbed in the back* by the
>very people who, a mere 10 years earlier, saved it back in '85!
>

A bit harsh and I don't think accurate! Poor marketing is closer.

>Atari is NOT just a brandname. It is a COMPANY name. And the only way you
>will ever see it carry the kind of weight it USED to carry is to restore it
>as both a brandname AND a company name.
>
>I mean, think of it... how hard (expensive) would it be to create an Atari
>software division that publishes titles of it's own? THAT'S where it all
>begins. Give "Atari" the distinction and entity it once had. And, you may
>well soon find out how much money you will rake in on that name alone!
>

Decent pitch but you offer no suggestions on implimetation.

>As long as Atari stands alongside Infogrames, who is to know if people are
>buying the game based on brandname recognition (and is it Infogrames or
>Atari they recognize?) or just because the game looks/is fun. What is your
>objective?
>

Again, they ARE Atari and their objective is the same as any company
looking to increase profits!

>Tossing a bunch of names onto a game title looks pretty haphazard to me and
>not something I would find appealing when buying the game.
>
>I really like Splashdown and I hope it makes it's way to the PC or Xbox
>soon. I have no plans to buy a Playstation2.
>

Why mention PC's or X-Box at all?

>Infogrames, as a brandname, has stood on it's own for years... Atari has
>too. But I believe the REALLY defining moment will be when Atari is the
>only name at the top (or bottom) of the box and sells a title based on IT'S
>name as a publisher, not just a "tack on" with others.
>

a mere technicality! As others have mentioned to you (who I also agree
with), it sounds like you're obsessed with the name "Atari"! Should I not
have bought my Falcon because it says C-LAB on the case and not Atari?

>It all begins with making "Atari" a division again. Let it stand on it's
>own. Let games like "Splashdown" ride on the waves that "Atari" (as a
>brandname) and the fun and graphical "wow" of the game itself produce.
>
>I mean, think of it for a moment... you "create" an Atari software division
>that publishes games for the PS2, Xbox, and PC under it's own name. You
>take the money from sales and keep stashing it right back into the division.
>From registration forms received, you notice that people bought the game
>mostly based on the name "Atari". Atari becomes "in" and recognized again.
>People really associated quality games/gaming with that name.
>
>You then create a small hardware division. You release one or two small
>devices (hand-held LCD games or even possibly a Cybiko-type device). They
>sells like hotcakes! People buy them based on the association that Atari
>represents fun and entertainment!
>
>From there... Atari begins it's comeback as a COMPANY! Selling it's own
>software, it's own devices... it's own games... it's own game systems...
>and... it's own COMPUTERS!!!
>
>And THAT, my friend, is how Atari is restored to it's former glory. One
>small step at a time. If the small step fails... you've lost little or
>nothing in the process. You back up and keep things the way they are.
>

Too much dreaming and not enough hard, cold facts! That is not enough
to a "how" to. Dig a bit deeper on how Infogrammes is to go about
implimenting your ideas. Give them a study containing stats, results of
nationwide poles (the good ol' pie-chart still works), marketing
strategies, costs of gear-up, resumes' of technicians and programmers
that are willing to apply themselves. Plan it out for them!

>But if the small step succeeds... and the next one succeeds... and the
>next... Infogrames could stand to make MILLIONS based solely on a brandname

>(and now a company) that was just a "tack on" brandname on a few game titles
>earlier.
>

A mere assumption on your part.

>As long as you just tack on "Atari" along with Infogrames, it shows to me
>that Infogrames doesn't have any real faith that the name "Atari" means
>enough to people/gamers to stand on it's own.
>
>And if that's the case, then what value does "Atari" really have to you?
>Not a whole lot as far as I can see...
>
>And that's the saddest thing of all...
>
>Jared
>

Sad? Corporations have no feelings!

>P.S. Give me a game with the name Atari on it and I'll buy it, based on the
>name and the fun of the game. Give me a game system with the name Atari on
>it and I'll buy it. Give me a (non-Intel (or clone)) computer with the name
>Atari on it...and you'll have me flying all over the house like a red rubber
>bouncing ball shot out of a rifle!
>
>I think you can see just how fond I am of what Atari has meant to me through
>the years...
>
>Give Atari the chance to be reborn and people like me will line up around
>the block to buy products based on that name alone.
>

not entirely accurate. If I have the story right, parents bought
Jaguars for their children at Christmas only to be returned to be left
on Walmart's shelves because the kids did'nt see it on TV like Genesis
and Nintendo! Give Infogrammes your marketing strategy!

>As to who (or how many of) those people are, you'll never know... until you
>risk just enough to take the first small step towards a potentially HUGE new
>future.
>

Better yet, get someone else to take the risk for them!!! Have you
contacted Gates? He may do it just for the fun of it :)
Hmmm....Atari's new X-BOX !!! (omitting the name Microsoft :).

>At least think about it... won't you?
>----------
>
>Critique as you like...
>
>Jared

>
>

OK! At least I had something to critique after all this time!!!

>haven't got the slightest funds to back your offer up?

Well, if y'all would stop working against me and started working WITH me, we might actually be able to get some material drawn up and get more people involved.

>Give it up, let the Atari users manage their future themselves.

If Atari users, alone, were my reason for this tirade I'm on again, I surely would have given up and stayed given up. But it's more than that. It's an emotional tie to something that never should have died and never would have died had things been done differently.

It goes without saying, and I use www.beunited,com as my reference to reality in all this, that if we actually work together towards restoring what once was and make it live again, you and all original Atari and Atari clone users will have, again, reason to stand proudly in the face of the majority and not flinch in the fear and reality of obsolescence... because obsolescence will be a thing of the past!

This is all I can say and all I can offer... hope and dreams for a generation left behind by careless management of a company we all drew great enjoyment and enthusiasm from.

It should NOT have happened, but it did. All I want to do is to at least do my best to try and undo the damage done by the fools who ran Atari into the ground and six feet under it.

>You really like Micro$oft, don't you? Get a PC and leave Atari alone.

I utterly dispise Microsoft (and, yes, I own/use a PC running Win98)... it's the graphics chipset of the Xbox that has me so excited. Without that, and the people who made it, I would have utter distain for the Xbox.

5192. BIG NEWS! The Atari Hotz MIDI Translator is Now RELEASED!

Newsgroup: comp.sys.atari.st
Date: 2001-11-17 07:35:56 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0111162335.47eb3d15@posting.google.com>
Source record: 40256

Hello All:

BIG NEWS

It is now a reality. One of the most sought after , coveteted and rare MIDI systems is now released as FREEWARE. The Atari Version of the Hotz MIDI Translator.

I have been working closly with Jimmy Hotz and Accordance Music Systems in creating a license Agreement and also special ZIPS of the software. The download page at Accordance is now completed, which is linked to my page:

http://tamw.atari-users.net/hotz.htm

This page also contains a Tutorial on how to use the software as well as Pics of the Hotz Box with many links to other Hotz pages on the net.

This is a very unique tool which is now released to an unsuspecting Atari-MIDI community. Please go to the page to find out more info about it as well as the download page of the software itself. However, you will need to agree to the license before you can download it. You will also need to provide your Email address and location. This is for Accordances's internal tracking purposes only. They just want to know who is actually interested in this type of software. Lets not dissapoint them!!

This is the cumulation of many months and YEARS of waiting on my part for this to finally happen! I was able to contact Jimmy Hotz thru formor Hybrid Arts programmer Tom Bajoras (who was the actual programmer for the Atari version of the Hotz Translator!) There were some legal issues to clear up before the release. Finally I contacted Accordance itself, which was the "current" Hotz Corporation. I had favourable response, and after several months now , it is finally released.

I am now happy to present the Atari Version of the Hotz MIDI translator. ENJOY!

Tim Conrardy

|
| XBOOT always runs from a cold boot, so after switiching on I can choose a
| set in XBOOT with the above commands as part of the set, and also
| MAGXBOOT. (Below is the set taken from the XBOOT SETS.DAT file)

OIC, i figured it out now, i'm not an autoexec user myself and i'd loaned
out my brain for the day when i read this.

Did you see my comments elsewhere about an autoexec equivalent for the
auto\apps folder, i dont recall the required name of the bat file concerned.

Hi,

There a number of atari TCP/IP packages. However for use on an STE you might
find
that the old KA9Q stuff would do nicley. Its on the UMICH archives
(www.umich.edu/~archive).
That will give you FTP. One of the later packages might have RCP but I have
not used them.

Dave.

Source record: 40267

Too much to wade through and stick my comments in, so I'll just reply at the top.

The progress that has been made in the Atari community is to be well and heartily commended. Of that I will not deny. What I see, however, is the downward spiral that is befalling the Atari community as we speak. Without Atari, it's all slowly winding down. Obsolesence is on your heels. Not just because you choose to use a non-majority computer (PC or Mac), but because people just choose to move on to a fully supported platform, even if they hate the thought of doing so.

The *really* lucky ones are those for whom the 1040ST (or any other Atari ST or Atari clone) is still their main computer and need nothing more/better. But the Internet is the "main show" and 3D games are the "main gig". Without modern hardware support, the systems just can't keep up and there isn't enough user-support to warrant doing so.

Now, think about another Atari clone being made by a company called Neotari (just for example). It's a PowerPC G3 model with a whopping 256Mb of DDR SDRAM memory (upgradable via 4 DDR SDRAM slots), [whatever Atari-compatible OS] in EEPROM (so that it's software upgradable), and all the slots and features you could possibly ask for. And it sells for $1,500.00!

Great, so you can run your old apps blindingly fast. Oh ,wait, you can't because they're not PowerPC native yet... gotta use emulation. What hardware do we emulate? But does that mean those apps will be improved or upgraded? Great, so you have a ton of memory and video fast enough to slap every web page silly, but does that mean that outside vendors will write drivers for their hardware so you can run it on your new system?

Unless every single Atarian and Atari developer and reseller band together to actually CREATE a clone community, any clone effort will be just like the last. And it won't last. And the outside world, if they even notice, will just chuckle.

The PC clone era occured because EVERYONE was making them. The brandname of a clone was as good as the original IBM's from whence they spawned. They created themselves out of the source original (IBM) and later BECAME the source original! And now there's no stopping them!

PC clones are nothing but a collection of similar, compatible parts that run the same OS. Faster CPU, more RAM, larger hard drive, better motherboard, etc. We choose what parts we want to make our PC's and then do benchmarks to brag about it.

In order for any Atari clone effort to have a lasting, permanant effect, we have to get the embers of the fire that has died down and rekindle it into a

blaze! But that takes organization and commitment to the cause.

It means deciding on an Atari OS standard, be it TOS/GEM, MagiC, MiNT, or whatever. It means deciding on a components standard that make up the motherboard. It means deciding that WE WILL NOT BE DENIED OUR FUTURE! The Atari clone effort, if it is to succeed and flourish, must be so organized and dedicated to the task, that we litterly recreate ourselves out of the ashes... just like the Phoenix.

It means having people create Atari-compatible motherboards and do nothing else (just like Abit, and Asus and others). It means having people organizing user groups and reinspiring the masses. It means creating enough models of Atari clones, from difference sources, that everyone has a choice! It means standing by the OS standard, optimizing it, improving it, and promoting it.

A clone effort, to really take hold and flourish, as the PC clones have, takes a lot of variety and willingness to not settle to one manufacturer and one brandname. It5 has to prove itself worthwhile and help inspire others to follow after it.

I've already written to the Calamus people and they've replied, stating support for any system that is TOS-compatible. If you didn't catch that reply I posted, just ask for it, I'll send it directly.

But the future of the processor standard is an issue. Do we make a clean break from the 680x0 line and it's kin and go with PowerPC or do we go with another processor/parts standard with an equally lengthy lifespan?

If we're going to do this, we have to be willing to make a lifelong commitment to the cause. Not just a few years more down the road, but forever. Can we do it? Are we willing to do it?

And where do we begin?

Jared

>Unfortunately that just wont be enough. You have to show them there's
profit
>to be made. That a business can function around your ideas. Otherwise there
>simply is no chance.

The first line of profit they make is from licensing the Atari brandname to us for use in a specific division that we (as a team) create. The second line of profit they make is from sales. They get everything we make, just outside of paying our employees and keeping the business running + some expansion, as needed, if needed.

The sweet part is that they pay nothing to start or continue the business. It's all profit for them and no expense. And it's their division! Afterall, it HAS to be laid out that way for them to have ANY interest. Otherwise, we have to show statistical facts and pie-charts and a whole bunch of other (probably unattainable) material to prove to them it would work, especially if they'd have to put money of theirs into a division they apparently have little to no interest in currently.

Now, if they would be willing to license the brandname "Atari" for use in this specific area, would we be willing to do all we could to actually make it happen? Would we be willing to spend the money to design the motherboards and port the OS to PowerPC and advertize and promote our new Atari division at such time as was appropriate? Or would we get the license and just sit on it until it expired?

What I propose is that we offer Infogrames a no-lose situation. We spend all the money and they make all the profit. We keep just enough to pay our employees and keep the business running and expand the business as needed. Personally, I think this is the only real, relatively easy way to get them to agree to it.

Coming right up....

Here it is:

Atari "brandname license" Proposition

As per this proposition, we request certain specifics and will abide by certain rules:

Specifics:

1) We wish to license the name "Atari", specifically related to creating a division that manufacturers hardware devices (computers, game systems, hand-held units, etc.)

2) We wish access to and permission to use certain pre-JTS/Hasbro aquisition assets, as available, if still available. Specifically, any and all computer and games system-related schematics, chassis mold designs, TOS/GEM source code, registration cards/lists, etc.

3) Licensing fees for use of the "Atari" brandname be paid on a per product sold basis.

Rules:

1) This proposal, once accepted, has a duration of one (1) year from the date of acceptance to yield at least one prototype of a working product. If no such product is created, this proposal and the acceptance of the specifics listed above will be considered null and void.

2) Any intended division, named "Atari", will not be made public knowledge until such time as there is at least one prototype of a product for production.

3) Any intended division, named "Atari" will be a sole subsidiary of Infogrames, if so required.

4) Any intended division, named "Atari" will be the full responsibility of those involved in it, neither requiring nor requesting any financial or decisionary involvement from Infogrames, unless deemed appropriate to do so by Infogrames.

5) Any intended division, named "Atari" will not manufacture nor sell it's own software. That will be left to Infogrames' "Atari" brandname.

6) Any profit brought in, minus amounts to pay employee wages and expand the division (if needed) go to Infogrames, unless decided otherwise by Infogrames.

Is thee still anyone who works with Xenomorph I and/or II? When I load an RD1 adjustment from Xenomorph I the update version crashes with the message: "memory block destroyed by user program" each and every time....

The strange thing is that this adjustment gives no problem in the previous version...But because Xenomorph II is enhanced with many more functions I prefer the update to work with. But I cannot use any former examples anymore...

Is there someone who recognizes this and has a solution?

Yes, off the profits. But how does one make those profits? Building a new system is far from cheap. Marketing it, even less so. How to get more developers? Users? Distribution? There have been many new hardware platforms. Most have been failures. Why would this succeed? What edge does it have on competitors? Even if Infogrames doesn't have to answer those questions, surely we certainly would?

You replied to all of my posts (or someone elses to mine) with equally hilarity. It's people like you who keep me going... really! If you weren't half so funny as you are, I would probably get so bored I'd probably have given up days ago...

But you know, you and I make such a team... I keep going and you keep bashing and I keep laughing and you keep bashing... it's like a vicious cycle of going and laughing and bashing! They should make our repitoire (sp?) into a stage show!

Although I hate to suggest something like this, since laughter doeth good like a medicine (and I'm so fit and healthy from all the joyous laughter you've pounded on my head, it's unreal!), but you might just want to ignore me awhile... it mgiht JUST get rid of me. But then, what would you do with all the spare time? With no one to insult and crash upon, you'd probably die of boredom!

Oh, and as a parting gift, for making me laugh so hard, here's a few feet of my lower intestines you can pile on your head like a turban! You should wear it with pride, you've earned it!

Jared

Jared

FYI, Falkemedia (publishers of /ST-Computer/) in Germany have
located a stock of Umax Mac clones and are selling them with
MagiCMac 6.20 on board starting (in their advert) from 499 DM or
160 UKP (without monitor - uses standard VGA). In the review the
prices are a little different: There is an Apus 2000 desktop
version for 549 DM (~177 UKP) and an Apus 3000 minitower at 599 DM
(~193 UKP). Both use a PowerPC 603e chip running at 200 MHz
(upgradeable to 280 MHz), with a 40 MHz system bus, have 4 MB ROMs
and 32 MB RAM (16 MB on board) expandable by another (now rather
rare) 2 x 64 MB 168-pin EDO DIMMs (the 2000 model needs an extra
riser/angle adaptor), with 1 MB video RAM (which may be replaced
by a more powerful PCI graphics card if required though low-priced
PCI models are hard to get new now), 2 PCI slots, sound on board,
2.1 GB IDE hard disk and 8x SCSI CD-ROM drives plus a Mac 1.4 MB
floppy drive, Global Village 33.6 Fax-modem, mouse, English
keyboard (but German MagiCMac).

Apart from MagiCMac there is an installed licenced Mac OS 7.6,
which can be upgraded to 9.04 (but not X as MagiCMac doesn't run
on that). Extras available include 512 kB and 256 kB cache
modules, 10/100 Mbit Ethernet card and 2-port USB cards at 45 GM
(~15 UKP) each, FireWire card, IDE and SCSI PCI adapter.

There is also a Super Pulsar dual 233 MHz processor model at a
higher price, but that does not include MagiCMac for some reason.

>If we're going to do this, we have to be willing to make a lifelong
>commitment to the cause. Not just a few years more down the road, but
>forever. Can we do it? Are we willing to do it?

Do you really think you can come up with *anything* that could
compete with that? Admittedly once their stock is gone, there will
be no more (unless someone can locate another unsold stash of Mac
clones somewhere). But at least this runs most ST/Falcon
applications, and around twice as fast as a Milan 040/25.

Regards, /Peter/

>| for money?
>
>Yes you have.

Ok, maybe the first time around, but this is a different plan!

>| No. Am I asking for hours of your time?
>
>Yes, you have.

No, just free time... if you have none, then go on about your normal life,
assuming your life can ever be considered normal. (grin)

>| No. All I'm asking is for people to just simply put their doubts and
>distain aside and imagine
>| "what if".
>
>OK, done that, youre still a blot on your family name.

How would you know? Are you related to me? I sure hope not... family
reunions would be murder... probably mine.

>OK, how about a TOS running

Possible, if someone can port it to PowerPC

>2Ghz with 512Meg of RAM

If we went with a G5 processor (for speed), yes, but I doubt the system
would be very affordable ($1,500.00 or less). The memeory would be nooo
problem... seen Crucial's pricing on PC2100 DDR SDRAMs (256Mb)... stack that
bugger with four and you'd have 1Gb of RAM all for under $100!

> And an 80G hard drive.

No problem! IDE or SCSI? Next...

>That's the 'current' market spec for a serious machine

I'd agree...

> Can you guarantee regular upgrades of the flash-ROM or
>disk based OS, via the web

Sure would try!

>updated versions of all currently available
>software

That's up to the individual programmers of the software in question.

>not like the current situation of having 68000 versions crippling
>their 030/060 hosts

Yup, don't want that! But the host would be PowerPC, so... um, maybe the "crippling" would be quite so... um, crippling? Look at how Apple managed emulation with their PowerPC systems. Very nice!

>support for any available graphics card

Eh... I'm figuring that would create too many driver developer headaches. How about if we just solder the guts of a nice Geforce 3 Ti500 (or ATi Radeon) to the motherboard and call it even?

>I'd want to
>try my 64Mbyte@400Mhz NVIDIA graphics card and expect drivers available on
>the WEB,

That would be default, if that's the chipset we used on the motherboard.

>would you promise support for 5.1 sound, so that when I smash my
>current PC I can also use its sound card

the nVidia nForce chipset has this...

I'm planning an upgrade to 1Gig of
>memory soon

Gotcha covered!

>so I'd also expect to be able to plug RIMMS into it as well

Nope, not going that Intel proprietary route.

it
>would be useful to be able to plug in my dual booting hard drive and use
its
>NTFS partitions, could you guarantee hard disk drivers, tape drive drivers,
>printer drivers, scanner drivers.

As provided by independant software/driver programmers.

>Now, I want a definitive answer to each of these serious requests.

I think I did a good job...

So, why should people bother to read and reply to you if you won't go through that trouble yourself? I think it is lack of respect to ignore peoples response really. You ask for response, and neglect the replies you get. Some are asking questions, those should be answered in replies. I think that is what usenet is all about.

> But the future of the processor standard is an issue. Do we make a

> lengthy lifespan?

Have you tried to see what projects are initiated already? There are projects that could have better chances of succeeding if they got help, instead of ppl starting things all over again.

I think the best bet when it comes to PPC-clones is to adapt OS's (MiNTor/and MagiC) to run with any of the existing PPC-boards.

There are efforts to make Atari software run on foreign CPU's, recently there was ARAnyM for example. It will for starters need a host OS though, but I guess it might be possible in the long run to have eg. MiNT running on "foreign" CPU's without need for Linux or Windows.

All in all, try and see if some project is already running that you can help out with. And do consider dropping the brandname issues, those are irrelevant to the vast majority of atari (or clone) users of today.

At last, a friendly tip: It is more likely ppl will bother reading your suggestions if you try and shorten things down a bit.

Regards,

Joakim

> keyboard (but German MagiCMac).

if anyone in the US is reading this, these models are known in North
America as the UMAX C500 (desktop) and C600 (mini-tower). The C600 is
the more desirable model, as not only does it have more room for
expansion, it also has an extra PCI slot. The DIMMs for these actually
have dropped in price in the last year, and can be had quite cheaply
(I've seen the 64 MB DIMMs for as low as $24.99 US). Also, you can get
an L2-slot based G3 upgrade for these from Sonnet as high as 400 MHz.

I had one of these for about a year, and it was an excellent little
computer for day-to-day tasks. I sold it to my co-worker when I got my
J700, and he's quite pleased with it as well.

It's never going to happen. Infogrames are never going to do this with
you. Their threats of legal action against a few Atari websites prove that
they will never co-operate with Atari computer users. They are just
interested in making money out of games.

You are one person. You'll never be able to get your ideas past the paper
stage. If you want to continue, as someone else said, approach Medusa
Systems and work with them.

PLEASE stop pestering us Atari users. I bet you don't even use an Atari
yourself.

Cheers!

>>Name me one company that has produced a kid/teen version of a successfull
>>produc and scored big with it....
>
>Ever heard of Cybiko? Go to their website (www.cybiko.com) and take look at
>their units.

No never heard of them, and from what I just saw on that website I'll probably never will. I've asked you to name me a company that marketed a kid version of one of their succesfull products and scored big with it, I didn't ask for a link to a toy company. Just in case you come up with another link: "scoring big" means that everyone on this planet wants it...
Search as much as you like, you will not find anything that qualifies. Kids don't want a "kid version" of a product. Kids want to be taken seriously and treated like adults.

>Think of it as a kind of "Pokemon PDA" (grin)

Keep on grinning.... but didn't you wanted *us* to take *you* seriously?

>These devices, however, would not cost anywhere near as much and are much

Hi Jared,

>And now another Email from me:

If you want to be taken seriously then at least you should show that you know what you're talking about... if I would be the CEO of Infogrames and receive a mail like the one you wrote...

The http://jaguar.infogrames.com/corporate/uk/corp_index.php" pages hold the necessary information to at least give you an idea what Infogrames is up to with the "Atari" brandname.

>May I ask, what exactly is the purpose of the "Atari" brand, if it is not a
>sole brand label on a product?

It *is* a sole brand, all future Infogrames products will be labeled Atari.

>Atari didn't program and isn't publishing Splashdown, Transworld Surf, or
>Transworld Snowboarding.

Infogrames is now Atari, meaning that Atari *did* program the games and they are also published under the Atari label.

>If Infogrames is the publisher of the title, why give any credit to "Atari"
>at all? What is the value of slapping another brandname on the box that
>really has NO relation at all to the game itself?

Atari is the publisher of the title....

>Surely there must be a hidden motive or reason. Are you trying to get the
>name "Atari" reassociated to the public in a way that will hopefully spawn
>enthusiasm to possibly a hardware division in the future?

Ever heard of a web based search engine? go and look for the Infogrames press releases from the last 11 months. These will answer the questions.

>If all you use (and plan to use) the name "Atari" for is to help pitch
>software titles published by Infogrames, that is, to me, perhaps the saddest
>end of a company's name ever. I call that "brandname prostitution", and I
>don't like it one bit.
Snipped the remaining drivel....

Jared, you want something badly that they've got. Accusing them of brandname prostitution is IMO not the smartest idea... nobody likes to be called a pimp.... don't forget they've payed 100 million dollars for it. That's a whole lot of money just to get laid ;-)

>Atari is NOT just a brandname. It is a COMPANY name. And the only way you
>will ever see it carry the kind of weight it USED to carry is to restore it
>as both a brandname AND a company name.

But Atari is a company again :-), it's a registered company under French law
with the major stockholder being SA Infogrames. They've registered Atari in
june 2001.

>I mean, think of it... how hard (expensive) would it be to create an Atari
>software division that publishes titles of it's own? THAT'S where it all
>begins. Give "Atari" the distinction and entity it once had. And, you may
>well soon find out how much money you will rake in on that name alone!

But that's what they are doing !!

>You then create a small hardware division. You release one or two small
>devices (hand-held LCD games or even possibly a Cybiko-type device). They
>sells like hotcakes! People buy them based on the association that Atari
>represents fun and entertainment!

Please forward your business plan and market anylysis that shows that these
small devices will sell like hot cakes.

>And THAT, my friend, is how Atari is restored to it's former glory. One
>small step at a time. If the small step fails... you've lost little or
>nothing in the process. You back up and keep things the way they are.

After calling him a pimp I don't think he'll want to be your friend....

>But if the small step succeeds... and the next one succeeds... and the
>next... Infogrames could stand to make MILLIONS based solely on a brandname
>(and now a company) that was just a "tack on" brandname on a few game titles
>earlier.

But they make millions... their net revenue is nearly 8 times higher then
what Atari made in 1990 (their best year). You do realise that you're telling
the second largest software publisher in the world how to conduct business?

>As to who (or how many of) those people are, you'll never know... until you
>risk just enough to take the first small step towards a potentially HUGE new
>future.

Multinationals don't like to take risks... since you claim it will be a huge
success and will sell as hot cakes, you're the one that will have to come up
with the papers and details to back up this statement.

Cheers from Belgium

Hi Jared,

>Infograms would profit from licensing the Atari name and access to certain
>assets related to it, which they have little to no interest in, plus gain
>profits from the division itself.

That's your perception.... but in real life things tend to be just a little more complicated. IMO if Infogrames would licence the Atari name (which will never happen) instead of profit from it they would lose fortunes. With the market situation being not exactly rosy at the moment, it could even mean the end of Infogrames AND Atari...

>"Atari" belongs to Infogrames and, therefore, any division created, by them
>or not. So, it only makes sense we should get what we want (Atari back as a
>computer and entertainment hardware company/division) while giving them
>something they want (mo money! mo money! mo money!)

No way...
Infogrames now is Atari and *that* makes a hell of a difference. Infogrames decided to use "Atari" as its global lead brand name while only retaining the Infogrames name for the holding company. You may not like this but viewed from a Wallstreet analyst or bankers viewpoint this was a master move. They could have invested fortunes in trying to make Infogrames a well known brand in the US or simply use Atari, which everyone after all already knows and loves. Does it surprise you that after this announcement in july their shares haven't stopped climbing, not even a tiny dip in september...
Now, imagine the impact on these shares if "your" product wouldn't be doing very well, everything Infogrames or Atari do or are involved with from now on has an impact on the stockmarket, if there's one thing a shareholder doesn't like then surely it's an investment without a guaranteed return. All you can offer is a dream, and a lot of "if"... you haven't got a clue if there is a potential market, and you don't have the money to research it either.

Infogrames has made it very clear that they will maximise the ownership of Atari and the CEO Bruno Bonnel has in several statements declared that if Atari wouldn't have been part of the Hasbro Interactive aquisition there wouldn't have been a deal at all. And this last bit has nothing to do with money but probably a lot with nostalgic feelings.

To rub it in:
Mr. Bonnel has done what you are dreaming off : revive Atari :-)

Cheers from Belgium
Dennis

| Hi all,
| This is mainly for Dr. Uwe Seimet.
| Some year in the past I tried to install a Quantum Fireball 850 MB to
replace
| an internal 48 MB HD in my Mega STE.

I had an 850M Quantam in my MegaSTE for some while.

| The software wich I used to partition the disk and install the driver was
| Atari's own AHDI utilities.

I couldnt do this step with AHDI, i used ICD, that was successful.

| I think I tried v4.x and v5.x. None of them recognized the drive, so I had
to
| purchase an ICD Link II external adapter and an SCSI case.

It would have worked with the Atari adaptor.

| Now I wonder if it was an issue of the driver software and HDDRIVER coud
| have done the job. Perhaps Atari software was restricted to "official
units".

I couldnt format and partition, i got the complaint that wincap wasnt up to
the job in some way.

| Is there rally a hardware limitation with bunled internal adapter?.

Only as far as parity is concerned, and you could have turned that off with
the Quantam.

| I'd rather prefer to have the unit internally.

You can, mione was there up until the point it died, and now i have a 4.5Gig
seagate internal with a Link 97.

Unfortunately you are correct. Too bad they could not be interested
just to keep the Atari name alive. Money rules.....

>toolbar looks weird then).

The manual has always come up for me. The one thing is that under Magic it would come up in black/white. Now in 1.26, it comes up in color. It still crashes when used with large PDF's. I have one over 9meg. Porthos loads the first page fine, but crashes if I go to any other page.

The author says that a newer version, 1.27 is coming out soon. I just hope people have registered this program. The author deserves support for his efforts.

Source record: 40289

Hi all,
This is mainly for Dr. Uwe Seimet.
Some year in the past I tried to install a Quantum Fireball 850 MB to replace an internal 48 MB HD in my Mega STE.
The software wich I used to partition the disk and install the driver was Atari's own AHDI utilities.
I think I tried v4.x and v5.x. None of them recognized the drive, so I had to purchase an ICD Link II external adapter and an SCSI case.
Now I wonder if it was an issue of the driver software and HDDRIVER coud have done the job. Perhaps Atari software was restricted to "official units".
Is there rally a hardware limitation with bunled internal adapter?.
I'd rather prefer to have the unit internally.

Thanks in advance.

Take your six foot Fuji and stuff it up your south-end hole! I don't want the name Atari and the fuji symbol just for the sake of the name and symbol alone... or have you been listening at all? I have NOTHING of either of those in my house (which I would if I was so enamoured by them as you believe me to be) and never will so long as no company is associated with them. The name and symbol mean *NOTHING* to me if they do *not* belong to a *company*! And I don't mean Infogrames, either. I mean Atari AS a company. On it's own. Selling it's own products, either software or (preferrably) hardware.

Than and *only* then will Atari and the fuji symbol truely mean anything to me once more. I just want to help that happen, hence why I am so adamant about all this.

I can appreciate your view, Gokmase, but the only reason I'm here is because everyone else is. If I just wanted to argue for arguings sake, I would reply in Email. But that's not my point.

Now if everyone truely WANTS me to leave, lets have a tally of votes. Or maybe everyone can pretend I'm just not here and eventually I'll get so bored with the lack of replies I'll just disappear naturally...

It's worked in the electronics repair newgroup. And I was looking for help there, too! Not trying to excite people with some insane ideas.

Isn't it odd that I should actually be giving people the secret of getting rid of me. A rather noble gesture, considering that if I were the muck and mire troll most seem to think I am, I surely wouldn't.

5233. Sony CDRW CD drive

Newsgroup: comp.sys.atari.st
Date: 2001-11-18 17:12:02 UTC
From: ebaiz@skyenet.net
Message-ID: <CZRJ7.3139$VS3.94232@newsfeed.slurp.net>

Hello all,

I was wondering if anyone has gotten one of the newer Sony SCSI CDRW drives to work on an Atari computer. I picked one up recently and tried to install it in my Hades. HDDriver and the installation program for Extendos recognize the drive perfectly. However, when I try to boot up the Extendos driver, it does not work. Strangely enough, after the attempted Extendos boot-up, the drive loses it's power. The only way to get it back is to turn of the computer and re-boot. Any ideas?? Should I try one of the other drives out or just call it quits?

Seriously, why don't you start your own company Jared - you are obviously very motivated to do this - and then, try to buy the rights from Infogames then? This will obviously cost you a *lot* of money I guess but surely this is what you are ultimately saying - as you want to be the "head" of this so called revised Atari company......I quote:

"happening... and leader of the same."

People who are heads of companies are normally either the owners who have put their _own_ money/houses/futures/wife's buisnesses on the line with all the risks involved. Or indeed, have been elected by shareholders (other ppl who have also put _their_ money in with all the risks etc etc...) so where do you stand in this equasion? As you have said in a previous quote:

"You assume that I would actually ask Infogrames to provide funds to start the division... I wouldn't, hence why my offer would possibly be even MORE attrative to them"

This wound mean either _you_ funding such a project or getting investers who trusted you with their money.............and as you would want to have licence to procure the following statement too:

"I will gladly forgive you for your errant attitude and permit you to join and make it all the better with YOUR ideas and input... if you qualify."

You would want substantial control?

As an observation, if you were not to have ideas and input from the more technically aware ppl left in the Atari world - of course only the ones who qualify(?) - where would that exactly leave your scheme?

Good luck to you, but please construct something more substantial and viable yourself before trying to ram it down ppl's throats here. (After all these postings I'm _still_ not sure what you want) If you did this maybe you would have recieved a different reaction possibly....I'm not sure.

>Yes, off the profits. But how does one make those profits? Building a new
>system is far from cheap. Marketing it, even less so. How to get more
>developers? Users? Distribution? There have been many new hardware
platforms.
>Most have been failures. Why would this succeed? What edge does it have
>on competitors? Even if Infogrames doesn't have to answer those questions,
>surely we certainly would?

Ok, let's just assume we can hire Rudolph Czuba to design a motherboard based on our specs [whatever they might be]. He's done it before...anyone found out how much time and/or money he invested into it? And, if not him, why not Medusa or Milan? A few changes to the previous design... the work has already been done to a large degree. We take what exists, make a few changes, and sell it!

Advertizing need not be extremely expensive. How expensive is it to start a website and then punch it into a few dozen search engines, and tell everyone you know that it exists? Want to spend a little more money? Newspaper ads and even cable promo ads (like those you see for all sorts of products). Keep the advertizing venues as affordable as possible and let word of mouth do as much for you as possible.

The Atari name, itself, would create a good portion of the buzz for you right off. The rest is showing you're dedicated to keeping it going and providing support to the old users and new ones, as aquired. You get the backing of some dedicated software/driver programmers and pay them for the work done outright or give them share in the company, either as a team member (VP, COO, President, etc.) or portion of the revenues.

Distribution? We arrange to have resellers stock their shelves with items based on a "you pay us our portion when you sell it." premise. That way there's no investment overhead they have to justify. One reseller of old Atari hardware that I Emailed stated he wouldn't be willing to sell new Ataris based on the fact that it would be too much of an investment for him, that old hardware simply doesn't cost him. We make that a non-issue for him by doing it this way.

The biggest hurdle, as I see it, is manufacturing... if the systems are built overseas, what complications are there with getting them here to the US, FCC Class B approval, Quality control, power supply voltage requirements, video output standard (NTSC vs. PAL), etc.

And, again, I point to: www.beunited.com for source of business model and effort to succeed. It may not be related to Atari, but it's a method which I think we would do well to consider...

When the message and it's replies are a mile long, it gets really difficult to go through and insert replies as needed. It wasn't intended as an insult, just a time-saving measure.

>Have you tried to see what projects are initiated already? There are
>projects that could have better chances of succeeding if they got help,
>instead of ppl starting things all over again.

I think this would also be good, but we need some way of reviving the sagging community in the clone sector. How do we do that?

>I think the best bet when it comes to PPC-clones is to adapt OS's
>(MiNTor/and MagiC) to run with any of the existing PPC-boards.

No question there... but we need to settle on a standard and go from there. Porting it to PowerPC is also necessary for efficient operation.

>There are efforts to make Atari software run on foreign CPU's, recently
>there was ARAnyM for example. It will for starters need a host OS
>though, but I guess it might be possible in the long run to have eg.
>MiNT running on "foreign" CPU's without need for Linux or Windows.

I think porting MiNT (or whatever) is more vital to the success than we think. If we run on a host OS (Linux, for example), the layers get complicated and head more and more in a non-Atari direction. Keep the OS "layers" as minimal as possible and as close to the original Atari version as possible, for best results.

>All in all, try and see if some project is already running that you can
>help out with. And do consider dropping the brandname issues, those are
>irrelevant to the vast majority of atari (or clone) users of today.

If we go the clone route, the brandname issue is moot, as it has been since it's inception. However, without brandname recognition, how do you propose we do any better than the current stock of efforts? I'm not out to just "do it again", I'm out to "do it to win!" If we don't succeed in actually recreating the Atari community and reviving it to self-sustainance, what

really is the point of doing it at all.

In analogy: I don't want to just have a few more hours to play at the park before I leave, with little to no hope of ever returning to play again. I want to build a home there and move in, so I can play there forever!

>At last, a friendly tip: It is more likely ppl will bother reading your >suggestions if you try and shorten things down a bit.

My apologies for being so long winded. I have a (bad?) habit of being rather lengthy in replies when using my computer. Give me paper and pencil to write down my replies and you'll find them to be VERY short! :-)

If that's their attitude, then so be it. But I wouldn't mind seeing some evidence of this ill-will to the Atari community. Just for my own curiosity.

>You are one person. You'll never be able to get your ideas past the paper
>stage. If you want to continue, as someone else said, approach Medusa
>Systems and work with them.

I would gladly do that, if I felt it would yield any lasting results. But I doubt that, without a wholehearted, concerted effort behind a clone community revival, it would last little more than a few more years.

I'm here to play in the sandbox forever, not just a few more hours.

>PLEASE stop pestering us Atari users. I bet you don't even use an Atari
>yourself.

You're right. I don't own an Atari computer anymore. But that's because I don't see a reason to when PC technology is so vastly superior and cheaper. However, provided a lasting, permanant revival were to be established, I would dump my PC in a second and go back in a heartbeat!

Hi Paul,
Thank you very much for your example of AUTOEXEC.BAT file.
Sorry for the delayed response. I have a couple of questions,
I hope you don't mind, 'cause there isn't very much information
on this in the NVDI or MAGIC manual.

AUTOEXEC.BAT: Are the *.PRG files above actual programs or
just the name of the program?

(I am only familiar with an AUTOEXEC.BAT file on PC platform.
BTW - not my setup.)
In that case I would use a command to call in the programs.
Ex.
PATH=C\WINDOWS;C:\;C:\DOS;C:\BATCH;C:

What is FPU__3.PRG used for?

> BTW, my AUTO folder order is as follows:
>

For the above *.PRG and *.PRX programs. I assume these are programs
in your AUTO folder and that you are referring to the running order
in xboot. Please correct me if I am wrong.

thank you

ken

Yes, you *do* want the name and the logo just for the sake of the name and
logo alone. There is absolutely nothing - I repeat *NOTHING* - amongst
Atari's assets and patents that can possibly be useful in a new
TOS-compatible machine.

Other than that I won't waste more time on you. You are an idiot. A
slightly amusing one, but you're starting to get on my nerves. Go away.

> Than and *only* then will Atari and the fuji symbol truely mean anything to

From: "Jared Falvo" <luposian@azob.quik.com>
Date: Sat, 17 Nov 2001 17:30:57 -0700

Hi Jared,

>>Now, I want a definitive answer to each of these serious requests.
>
>I think I did a good job...

I disagree. You haven't answered one question properly. But this isn't really very surprising, these silly threads have been running long enough now, it's time to wake up and realise that you can't build a succesfull computer anymore from scratch and assemble it in your garage.

>>updated versions of all currently available software
>
>That's up to the individual programmers of the software in question.

No!! it's entirely up to you. You're the one building the computer, it's your responsibility to make sure that when its released the customers can actually use it. Get in touch with all the software houses and individual programmers, tell them what is coming soon and ask them very politely to update their apps, after what happened with the MilanII, you will need very strong arguments to convince them to take another (financial) risk.... so you better offer them a contract and pay up front. Oh and don't forget to send them a developers kit and computer as well.
If you want to sell more then a couple of hundred computers then you'll have to attract new users or put in other words: suck them away from the PC and/or Mac platform, even if you build a dream machine, it will only be usefull with software that exploits its features. The existing Atari software may be good enough for the ancient machines, but you will not attract one single new user with it. So, the very first thing you need to do is to convince all the major software publishers to support this platform and release their most succesfull titles, without Adobe, Lotus, Microsoft etc.. backing you *all the way* this new dream machine has no chance of ever becoming a huge success. All that you will be able to achieve is what Milan and Hades did before, sell a machine that only the die hard Atarians may want, and at $1500 a piece I don't think they will storm your shop either.

Put in other words: forget all about it. If you ask an ex-Atarian why he left this platform there's one consistency: they couldn't use the crap from M$ that their working with at work, games, MP3, Internet etc... you never told us why you needed to switch to a PC... The battle is over, and the winner is the PC. It's not the hardware that was the basis for this success but the software. So if you really want to do something for this platform start bothering Adobe, Lotus, Coral, Microsoft etc... once you've convinced them, come back here and

then start talking about that new Atari dream machine. In the mean time we'll
do what we've been doing for the last decade: move on....

Cheers from Belgium
Dennis

Hi Ken,

>How many postings a day were there 3 years ago? Will there be any postings
>3 years from now? Probably, but I think it would be a safe bet the number
>of postings will be far fewer than 60 a day. :-(

It's not the number of postings that is important put the number of people
following this group. Last week an idiot has nearly doubled the traffic in
this group here all by *himself*, I rather see the number of postings drop
then having to wade through heaps of postings containing only nonsense.

To stay on topic: threads like these do have a function, it might have gone
unnoticed but for the last three weeks Sierra Bravo has treated us only to
one SPAM posting a week. :-)

Cheers from Belgium

Hi Peter,

>FYI, Falkemedia (publishers of /ST-Computer/) in Germany have
>located a stock of Umax Mac clones and are selling them with
>MagiCMac 6.20 on board starting (in their advert) from 499 DM or
>160 UKP (without monitor - uses standard VGA). In the review the
>prices are a little different: There is an Apus 2000 desktop
>version for 549 DM (~177 UKP) and an Apus 3000 minitower at 599 DM
>(~193 UKP).

Falkemedia located these from http://www.newsell.de , Newsell their prices
are considerably lower and they offer a much wider variaton to choose from
as well. Don't forget that existing MagiC users can upgrade to MagiCMac
for a nice price and anyone who has bought something from ASH in the past
can buy it at "PowerUser" price...
Newsell also sells CD-R, Umax scanners and SCSI hard disks. Some of these
are priced very attractively. So, this is definitely a site to put in the
hotlist of CAB.

>But at least this runs most ST/Falcon applications, and around twice as
>fast as a Milan 040/25.

The Pulsar problaby is twice as fast a standard Milan, but the Apus models
will have a very tough time to keep up with a Milan... Falcon applications
don't run under MagiCMac on these machines. To run Falcon apps one still
needs a Falcon ;-)

Cheers from Belgium

I think I found all I need... in the FAQ of the site you've listed.

Q: Through its acquisition of Hasbro Interactive in 2001, Infogrames
Entertainment became the owner of the Atari brand. What plans do you have
for the Atari brand?

A: Atari is perhaps the most illustrious name in the interactive game
industry and we are thrilled to have it as part of the Infogrames family. We
want to be true to the innovation that marked Atari's launch 20 years ago.
With that in mind, we are re-inventing Atari for a new generation. Our
inaugural titles, Splashdown, MXRider and Transworld Surf, all of which will
launch in November 2001, capture the qualities we believe will define the
re-invented Atari. They are innovative, unique, exhilarating, breakthrough,
and genre defining games. You can expect to see a great deal more from us
regarding Atari in the months ahead.

The "jaguar" prefix in the URL made me think they were actually considering
gaming hardware again, but haven't seen any indication of same on the site.

I think I'm about done.

Hello Everybody,

I just got my first atari Falcon and I have a couple of questions as I have never really worked with an ST or a Falcon before. First, I have downloaded some programs off the net and got them to work great with extensions of .prg but how do you get programs with extensions .st to work on a real falcon? Is there any way to convert them to extensions that the Falcon can recognise? Also, is there a way to quit any running program and get back to the desktop? One last question, does anybody know where I can get a copy of cubase?

Thanks,
Michael

After much consideration and insight from Dennis Vermiere (sp?), I've come to the conclusion that not only is Infogrames dedicated to the Atari name, but that they wouldn't be willing to consider licensing the name because of a multitude of other considerations.

It is with factual realization that I abandon my 2nd attempt at an Atari revival based on aquiring the name or outright purchase of the company. It just isn't going to happen. I now realize and accept this.

However, the possibility of reviving the Atari community is still viable, if we work together on it with a 110%, no-holds-barred, take no prisoners, winner takes all attitude. It will take amounts of effort that no one yet has invested to the degree necessary to achieve, but we can do it if we are willing to. If Atari clones are to revive and continue on, to a self-sufficient/sustaining degree, they must reinvent themselves as the ultimate *source* from whence they spring forth. In other words, we must do what the PC clone makers did in their early beginnings. Without this, I see little but failure once again. Are we willing to commit to that level? I am, where I can.

If anyone wishes to agree/disagree or discuss this last avenue any further, I will be here.

I will refrain from continuing previous posts any further.

In the clone effort, we must decide on an OS standard as well as develop a hardware solution and stick with it. We must be willing to dedicate hours of time and bounties of effort and energy that we take for granted. Time and energy and money are what it will all boil down to. Many parts of it have been done or partially done for us. Let us take these portions and finalize them into the future we desire... that we've been denied in the death of the old Atari.

If we're lucky, the new "Infotari" will some day make computers and game systems again. But let us not wait and twiddle our thumbs awaiting that day, but rather, let us be up and about doing that which will achive the victory we so desire!

So, where shall I fit in? Any ideas? No sarcasm or insults, please. I'm not going to go that road any longer. Such comments will be entirely ignored.

5258. The standard for a revival...

Newsgroup: comp.sys.atari.st
Date: 2001-11-19 06:29:51 UTC
From: Jared Falvo <luposian@azob.quik.com>
Message-ID: <sD1K7.867$gV1.61822040@news.incc.net>
Source record: 40222

Let's assume we, as a united effort of both US and foreign Atarians and ex-Atarians, will attack this matter with all due diligence and fortitude.

Let's decide on the first two issues of importance:

1) The OS we will use
2) The CPU and subsystem hardware

And them follow it up with the consideration:

1) Will we need to port it to the new CPU standard we've chosen?

My vote is for:

1) MiNT or MagiC (MiNT, as far as I know is CLI, needs a GUI over it; does MagiC require a GUI or does it come with it's own?)

2) PowerPC 603e (minimum, G3 possible; soldered onboard), AGP 4x slot, three or four 66MHz PCI slots, four or eight DDR PC2100 SDRAM slots, two 2.0 USB (can handle a bunch of possible peripherals, like keyboards, mice, joysticks, speakers, printers, etc.), IDE UDMA/66 or UDMA/100, EEPROM-based OS (for loading speed and upgradability), etc.

Followed up with:

1) Yes, we probably will need to port the OS to the hardware, as far as I know.

Most Quantum Fireball require initiator identification, which is a
feature that is only provided by the LINK96 and LINK97 adapters.

.ST files are diskimages - files that contain the contents of a whole disks.
Use a program likeMakedisk to transfer them back to a real disk.
But beware: .st files are almost always DD disks not HD disks.

http://home.tu-clausthal.de/~ifmar/makedisk/ for a short tutorial.

I see the word "porn", I assume it to BE porn. Why would someone use incorrect words to describe something, hmm? It only later occured to me, because of some of the wording in the URL, that it was probably some huge FUJI or some such. Not my cup of tea... never did look at it.

When I see that Atari has taken it's rightful place as a software/hardware company again, I will reconsider "worshipping" the FUJI once again. But not today. It holds some fading fond memories, but little more at this time.

Ok, then, describe for me what the reading/writing level would be for a true moron. I'd be willing to suspect that it would be that of a child of 5-10 yrs. old, if that. If not their entire mental level as well.

I suspect no true moron could graduate high school, attend college, or achieve an A+ Certification for computer repair, etc. (as I have) Although I have heard of so-called idiot savants, not exactly sure what those are.

However, I will accept your use of the word, as a derogotory. If that's your opinion of me, you have a right to it. Doesn't make it so, though.

I suspect the .st files you're referring to are possibly emulator-specific files (like a disk image or such). Valid file extensions for the ST/TT/Falcon/Clones are as follows:

.PRG (Program)
.TOS (TOS program)
.TTP (TOS Takes Parameters)
.RSC (Resource)

The Atari scene has dried up a lot in recent years. Emulation seems to be the going trend. However, a diligent search across several "search engines" (Netscape has several) under headers like "Atari TOS", "Atari ST" "Atari ST software", etc. should yield significant results.

As well, there are many fine individuals here in this newsgroup that can help you find more of what you seek.

That's how the Confederacy thought!!! But without the factories
needed to manufacture clothing and weapons, all the good will and
dedication in the world was'nt enough!!!
These are different times than the days when an Atari sold music
computers almost by word of mouth! For Atari to compete against todays
computers, they need BIG backing of a computer that does EVERYTHING
conveniently and at todays TOP speed! A built-in backward compatibilty
(good idea Ctirad!) would give it a jump start being able to run not
only new programs but the meriad of great past programs.

>If Atari clones are to revive and continue on, to a
>self-sufficient/sustaining degree, they must reinvent themselves as the
>ultimate *source* from whence they spring forth. In other words, we must do
>what the PC clone makers did in their early beginnings. Without this,
>I see>little but failure once again.

And what was it that PC's did back in 1987? The PC was (and maybe
still is) Piece of Crap with hardly any memory, NO sound cards or modem
cards (I believe) and needed 2, 5"+ disks just to get a desktop! Wheras
Atari had 3 1/2 disks and OS in ROM = a desktop with NO disk needed!!!
What PC's did have was IBM's entrenchment in the business world.

> Are we willing to commit to that level? I
>am, where I can.

Hi shitface

| After much consideration and insight from Dennis Vermiere (sp?),

Thank christ!!, Dennis i want your babies, again.

|I've come

That was sujjested elsewhere.

| to the conclusion that not only is Infogrames dedicated to the Atari name,
| but that they wouldn't be willing to consider licensing the name because
of
| a multitude of other considerations.

!! Bing !!

| It is with factual realization that I abandon my 2nd attempt at an Atari
| revival based on aquiring the name or outright purchase of the company.
It
| just isn't going to happen. I now realize and accept this.

2nd, it sound like your notepad needs reviving also.

| However, the possibility of reviving the Atari community is still viable,

It doesnt need reviving arsehole, its quiet healthy.

| if we work together on it with a 110%, no-holds-barred, take no prisoners,
| winner takes all attitude. It will take amounts of effort that no one yet
| has invested to the degree necessary to achieve, but we can do it if we
are
| willing to. If Atari clones are to revive and continue on, to a
| self-sufficient/sustaining degree, they must reinvent themselves as the
| ultimate *source* from whence they spring forth. In other words, we must
do
| what the PC clone makers did in their early beginnings. Without this, I
see
| little but failure once again. Are we willing to commit to that level? I
| am, where I can.
|
| If anyone wishes to agree/disagree or discuss this last avenue any
further,
| I will be here.

Dont bother, piss off!!.

| I will refrain from continuing previous posts any further.

Is this stored as a macro on your system.

| In the clone effort, we must decide on an OS standard as well as develop a
| hardware solution and stick with it. We must be willing to dedicate hours
| of time and bounties of effort and energy that we take for granted. Time
| and energy and money are what it will all boil down to. Many parts of it
| have been done or partially done for us. Let us take these portions and
| finalize them into the future we desire... that we've been denied in the
| death of the old Atari.
|
| If we're lucky, the new "Infotari" will some day make computers and game
| systems again. But let us not wait and twiddle our thumbs awaiting that
| day, but rather, let us be up and about doing that which will achive the
| victory we so desire!
|
| So, where shall I fit in?

Your arse as usual.

| Any ideas?

None i wont arrested for!!.

| No sarcasm or insults, please.

Oops!, i hadnt read this far.

| I'm not going to go that road any longer. Such comments will be entirely
| ignored.

Why don't I believe this line!!.

Hi Edward,

ESBJ>HDDriver and the installation program for Extendos recognize the
ESBJ>drive perfectly.
as a reader or as as a writer or as both?

For just reading you'll need a METADOS installation (e.g. SPIN!...).

For writing METADOS is _not_ necessary! You just run SCSI driver
stand-alone or as built-in to e.g. recent HDDRIVER versions. And
EXTENDOS or CDRECORDER afterwards, of course.

ESBJ>Strangely enough, after the attempted Extendos boot-up, the drive
ESBJ>loses it's power.
Does any different drive behave the same way? I hope you do not send
an unwanted 'goto bed' command to your drive!

I suppose your SCSI chain is made up the correct manner and perfectly
terminated!

Und TTschï¿½

Hey, you gave it your best shot. Just stick with an Atari computer or clone and be a supportor like myself and others. Pick yourself up a Hades or a Milan or wait for the new clone. There are plenty of Atari software authors out there that need support.

I know one place I won't be buying from now. I'll be avoiding the BS for my non-auction needs...

For those looking for a reputable shop, I recommend B&C ComputerVisions at http://www.myatari.com. They've been around for years..back in the 80's when I lived in the SF Bay Area I not only bought from them but had them repair some hardware (my old 810, still in use today).

Stay away from the BS shoveled by spammers...at least check out someone who can afford his own domain name...

Paul

Steve,

Thanks for exposing your experience. Now I see that is posible. Not
only parity, but also leaving the drive unterminated (and ID 0) was
required, as I read in some other postings about the same questions.

I have a mega ste (2.05) 4 MB wich refuse to properly run chuchu rocket !
I made a disk with the game to be able to test the same binaries on my mega ste and on my 1040 ste.
Has you can guess, on the 1040 there is no problem at all !
I could play it on 1040 but it'll be nicer with hard drive !

The symptoms are : no graphics, sounds ok,only blinking cursor up left...

thx for helps !

But if that were the case with the unit I have, It woud'nt have worked either
with the ICD Link II adapter.
Anyway, I also have been given recently an old Quantum Capella (1 GB).
Is this other unit more suitable to work with HDDRIVER / internal controller?.

5285. Re: BIG NEWS! The Atari Hotz MIDI Translator is Now RELEASED!

Thanks Steve. I just found out however, there was a problem with the A
drive version not fitting on a 720K disc. I have made a fix for it and
it is updated on my Hotz page as well as Accordance.

Accordance just reported that in the past few days since it was
released there have been 40 downloads! Thats pretty good for an off
the wall program!

>I disagree. You haven't answered one question properly. But this isn't
really
>very surprising, these silly threads have been running long enough now,
it's
>time to wake up and realise that you can't build a succesfull computer
anymore
>from scratch and assemble it in your garage.

It's not that you CAN'T. It's that you WON'T. There is a big difference.
And it circles around money and cooperation, plain and simple.

>No!! it's entirely up to you. You're the one building the computer, it's
your
>responsibility to make sure that when its released the customers can
actually
>use it. Get in touch with all the software houses and individual
programmers,
>tell them what is coming soon and ask them very politely to update their
apps,
>after what happened with the MilanII, you will need very strong arguments
to
>convince them to take another (financial) risk.... so you better offer them
a
>contract and pay up front. Oh and don't forget to send them a developers
kit
>and computer as well.

Money and *cooperation* would solve this whole problem. Never forget
that. But living in the land of emulation on a PC is not going to make a
spitoon full of chaw juice worth of difference in the existing community.
It's just going to push ancient software onto another platform do you can
keep using ancient software. It will not make it run better, just perhaps
faster. And, fact enough, faster doesn't make it better.

>If you want to sell more then a couple of hundred computers then you'll
have
>to attract new users or put in other words: suck them away from the PC
and/or
>Mac platform, even if you build a dream machine, it will only be usefull
with

>software that exploits its features. The existing Atari software may be
good
>enough for the ancient machines, but you will not attract one single new
user
>with it. So, the very first thing you need to do is to convince all the
major
>software publishers to support this platform and release their most
succesfull
>titles, without Adobe, Lotus, Microsoft etc.. backing you *all the way*
this
>new dream machine has no chance of ever becoming a huge success. All that
you
>will be able to achieve is what Milan and Hades did before, sell a machine
>that only the die hard Atarians may want, and at $1500 a piece I don't
think
>they will storm your shop either.

If you have no hardware, with what reason should they write software? It truely is a chicken 'n egg scenario. Who comes first?

But you're right... it's pointless to live in the Atari past when there is so much future in the PC arena... and even more so with the Power Macintosh G5's coming out soon!

>Put in other words: forget all about it. If you ask an ex-Atarian why he
left
>this platform there's one consistency: they couldn't use the crap from M$
that
>their working with at work, games, MP3, Internet etc... you never told us
why
>you needed to switch to a PC... The battle is over, and the winner is the
PC.
>It's not the hardware that was the basis for this success but the software.
So
>if you really want to do something for this platform start bothering Adobe,
>Lotus, Coral, Microsoft etc... once you've convinced them, come back here
and
>then start talking about that new Atari dream machine. In the mean time
we'll
>do what we've been doing for the last decade: move on....

As long as no one does anything to stop the crumbling wall from crumbling, it will fall to rubble eventually. The 680x0 line is dead. We have to jump to PowerPC to even have a hope of *any* future. You can go with source performance or emulation on hot hardware. I'd rather have source performance, myself. But that takes money and cooperation. Shame no one is really willing to give either.

As I've asked previously, how much did Rudolph Czuba spend to create his projects? How much was invested to create the Milan or Hades clones? How much would it cost to modify them for PowerPC?

Give me some cold, hard figures and we can decide if this truely is impossible, financially or not. Cooperation is an even more important matter, for without it, nothing done will beget nothing achieved.

Jared

This sounds familiar, it my be that you have too much memory, istr a utility
called "MAKE_1M.PRG" that fooled the machine into thinking it had only 1Meg
of memory, allowing this game to run.

Dear Atari users,

I have an accelterated Atari Falcon030 system sitting in my loft which
I am interested in selling. I have a Falcon030 (16mb RAM, 540mb HD) in
a 19inch rack mountable Lighthouse case with external PC keyboard
along with 15inch Panasonic monitor and LOTS of software (including
papyrus, Audio Master, CAB, MagiC, TruePaint etc. etc.)

For more info, please contact matt@tvsoundman.co.uk (offers in the
region of ï¿½400 - reluctant to split). UK based, near Kingston, Surrey.

Would make a great XMAS present!

The 'Sale Conditions' and 'Ordering Instructions' sections are at
the end of this message. Please read them both carefully *BEFORE*
asking any questions, or placing any orders. Thank you!

*IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT**IMPORTANT*

This list was last updated on 11/20/2001

NOTE: There are currently 1958 ORIGINAL game screen shots available
on my web site. Unfortunately, none are for the Atari ST computers,
at this time...

NOTE: There are currently 857 game manuals available on my web site.
Unfortunately, none are for the Atari ST computers, at this time...

NOTE: The Video Game Advantage Definitive Known Software List
Collection is currently on-line! Unfortunately, there is no
list for this system (cartridge and CD based systems only).

I have the following Atari ST software for sale or trade.

SOFTWARE:

ATARI ST COMPUTER:

New diskette(s) [still shrinkwrapped! Includes box and manual]:
$ 3.00 Art & Film Director (Epyx) -- $5.20 shipping, due to
weight, counts as 1st item
$ 3.00 Death Sword (Epyx)
$ 3.00 Devon Aire in The Hidden Diamond Caper (Epyx)
$ 3.00 Final Assault (Epyx)
$ 3.00 GFL Championship Football (Gamestar)
$ 3.00 Keith Van Eron's Pro Soccer (Microplay)
$ 3.00 Lands of Havoc (Antic Software)
$ 3.00 Mean 18 Famous Course Disk Volume II (Accolade)
$ 3.00 Metro Cross (U.S. Gold / Epyx)
$ 3.00 Paint Pro (Abacus Software)
$ 3.00 Quadralien (Spinnaker)
$ 3.00 Renegade (Taito)
$ 3.00 SwiftaR (Accustar)
$ 3.00 Techno Cop (U.S. Gold / Epyx)

$ 3.00 Warship (Strategic Simulations, Inc.)
$ 3.00 World Karate Championship (Epyx)

New diskette(s) [ripped/no shrinkwrap, includes box and manual]:
$ 3.00 Art Library 2 (Melody Hall) -- RIPPED SHRINKWRAP!
$ 3.00 BCPL Compiler (MetaComCo) -- RIPPED SHRINKWRAP!
$ 3.00 Cyber Print (Antic Software) -- NO SHRINKWRAP!
$ 3.00 Slayer (Hewson) -- NO SHRINKWRAP!
$ 3.00 Tower Toppler (Epyx) -- NO SHRINKWRAP!

Used diskette(s), with box and manual (as described):
$ 6.00 1st Word Plus / 1st Mail [GST] -- 242 page manual in
binder, slipcase, cardboard cover, and two 3.5" diskettes
-- $5.20 shipping, due to weight, counts as 1st item

$ 6.00 BOS: Business Operating System V5.1 [BOS National]
-- 138 page manual, 18 pages of supplements and two
3.5" diskettes

$ 6.00 MasterPlan: Financial Spreadsheet [Ditek Intl.] -- box,
172 page manual and one 3.5" diskette

$ 6.00 Personal Finance Manager [MichTron] -- box, 68 page
manual and one 3.5" diskette

$ 6.00 STOS: The Game Creator [Mandarin Software] -- box, 294
page manual, 6 page Basic reference card and three 3.5"
diskettes

$ 6.00 Superbase Personal 2 [Precision Software] -- box, 300 page
manual, 18 page manual supplement, and one 3.5" diskette

$ 6.00 TimeWorks Desktop Publisher [TimeWorks] -- 270 page manual
in binder, slipcase, and six 3.5" diskettes -- $5.20
shipping, due to weight, counts as 1st item

$ 6.00 Trinity [Infocom] -- box, 26 page manual, cardboard
sundial (never put together!), 15" x 22" poster/map,
7" x 13.5" poster, 4 page Reference Card and one
3.5" diskette

*****

SHIPPING ANYWHERE IN THE CONTINENTAL U.S. is $3.95 for the first
game and $1.25 for each additional game. Shipping for hardware and
accessories depends on weight/distance. Large orders will be weighed
as a package, to reduce shipping costs. Foreign orders welcome.

SALE CONDITIONS:

1) Sales are first come, first served. If you are looking for
something that isn't listed, please don't ask (because if I
had it, I'd list it).

2) Everything is sold as is. Unless specified, all games and
systems have been tested and are in working order. I very
rarely sell items that aren't working, but if I do, they are
clearly labeled as such.

3) Trade offers, in particular for items that I need, will be
considered (especially if the trade offer overwhelms me). I
collect for over 50 different systems, so please feel free
to send me a trade list.

4) Buyer has seven (7) days to send payment, and pays all shipping
costs. Shipping cost depends on both the weight of the order
and the distance that the order must travel, unless a set
amount is already listed. No orders will be sent C.O.D. So
if you can't mail the payment within 7 days, please do NOT order!

5) Since items will be held specifically for you, if you aren't
serious about buying, please don't place an order!

6) No package deals on games or systems. All prices are clearly
listed. There is no minimum order.

7) If you have a problem with the listed price, please remember
that nobody is forcing you to buy from me. I have been in
business since 09/05/93, so I have a good idea how to price
items. My personal philosophy is that something is only worth
what someone is willing to pay for it.

8) Payment must be made in U.S. funds (either Personal Check, money
order, Cashier's Check, cash or PayPal. Orders from outside the

Message-ID: <eBnK7.897$2q2.63722611@news.incc.net>
Source record: 40158

Does anyone know if anyone is/was working on or has attempted a
PowerPC-based Atari clone? If not, I'm doing a bit of research into it.
There may yet still be a chance.

Also, has anyone researched into the viability/liklihood of porting MiNT (or
whatever OS one might consider the best for an OS Standard) to PowerPC?,

BTW, what is this "new clone" you speak of? The Milan II is dead, from what
I've read. What else is there out there and who is working on it? Please
also give me the list of these software authors in the Atari scene that need
support. Those are the very lifeblood of any new attempt in cloning one
might consider... or is presently working on.

Jared

For HDDRIVER this doesn't matter. This is completely a hardware-related
issue.

If the drive does not work with another ID than 0, HDDRIVER is not
correctly configured. Please refer to the manual for details.

Hello.

Is it possible to connect a normal seriell PC-mouse to the ATARI 1040 STF?
My original mouse is gone.
I heard from a hardware solution, but i like to go on first with a software solution.

Somebody know a software tool to solf my problem?
Where can I find this tool?

Thanks

Michael

You can find the soft on the Belgian ftp-server
ftp://chapelie.rma.ac.be/atari/utilities/
genmouse.lzh
mouse26beta.lzh
mouse26s.lzh (sources of mouse26beta)

It's possible you need both genmouse and mouse26beta.lzh. The docs are
in English/German.

Jared,

The biggest problem we suffer from is not the lack of nice hardware, it's the software. Why not focus your energy on software instead? There is a lot of unsupported, abandoned, commerscial software. Get people to release their sourcecode or something. This is something _every_ Atari user could benefit from.

Regards

/Peter

Usually Robert is very fast. In fact he uses auto-response, I
believe, to mail out keys. I downloaded this and several other
DOITs some months back, but the DOITLYNX and DOITST1H and 2H files
were corrupt, though the rest were OK. Tried it several times,
as did Derryck, but something seemed to be missing at the end
- after a looong download time too :-(They just woudln't unpack!

I will soon send Robert 15 DM to get them on a CD instead. Got to
get rid of my few remaining Marks by the end of the year :-)

Regards, /Peter/

>finalize them into the future we desire... that we've been denied in the
>death of the old Atari.

From my point of view, if the OS is not able to run many or most
of my 1000s of applications, I ain't interested. The only reason
for staying with Atart (apart from the fact I hate the waste of
resources and bloated programs of M$) is to run these apps. Sure,
I like the interface and I'd love a lot of extra speed, but it
ain't going to happen. The best one can hope for is an emulator to
run TOS and MagiC (and MiNT) programs on a PC or Mac - like the
Umax clones I posted about.

If you have not registered, then that is why you only get one page. If
you load in the manual (I get it in color now with version 1.26), you
will be able to get all the pages, but just the manual only until you
register. Take care...

Well, the fact is that I don't have HDDriver, but I will purchase it if it can
drive a big hard disk internally with the original controller. I also would
benefit from the other advanced features of the software.
From the postings of Steve and you, I must conclude that the controller is
hardware capable and then HDDRIVER can be used to format, partitition
and boot such hard disk (if it doesn't need initiator identification), which
was not the case with AHDI.
Am I wrong?.

Regards.

Sting is much better to use, but there is one other program for
connection, that seems like program to connect on PC computers. The name of
program is Connect.prg. I use Atari for quite some time And I think that I
have that program on disquiet. Program that I mention comes when you install
CAB for internet, and the best program for e mail on Atari machine is
Emailer version 2.3F or 2.3. The operative system that is needed for Cab and
email program Emailer v2.3f is Magic version 5 or even better 6. If you need
those programs mail me I think I can help. For old good times.

All,

I am going to attempt to sell all of the below as a package.
The reason being is that I don't want to un-install the software :),
and it all seems to work so well together. If no acceptable offers
have been received by the end of two weeks, I'll either post it on e-bay
or break it up into smaller packages. Also note that some of the items
are negotiable as to whether to include them in the system or not;
e.g. if you don't want the monitor, it'll reduce the price of the
overall system. Atari specific stuff (e.g. the Nova card) are not
negotiable in this manner.

All negotiable items are marked with an asterisk ("*").

Commercial Software Development and License (yes, you can
update these and sell them within the terms of the agreement)
---
o Diamond Back
o Diamond Edge

Hardware
---
o Falcon 030 in C-LAB MK-X Case
o 1.2 GB Internal Toshiba IDE hard drive
o Afterburner040 w/hardware switch to switch back to 030
o 36 MB RAM (4MB on board, 32MB on the Afterburner040)
o Nemesis accelerator
o Nova 64-bit graphics card with 2 MB VRAM
o QWERTYX AT keyboard/serial mouse adapter
o Mega STe keyboard
o Microspeed keyboard
o Golden Image mouse
o Other mice from other manufacturers.
o Motorola 28.8 external modem
o External monitor switch for Nova/Falcon video output
o All necessary interconnecting cables and power supplies
o Wangtek Model 51000 1.2 GB SCSI tape drive
o 3 Maxell 1.2 GB QICs for Wangtek drive (these are $30 each new)
o Assortment of 150 MB and 525 MB QICs that work with the Wangtek drive
o 4.3 GB Internal IBM SCSI hard drive
o 2 Radio Shack joysticks w/suction cups
o QuickShot II Turbo joystick
o Wico Command Control joystick
* Yamaha CRW64 Internal SCSI CD Writer

* MicroTek Scanmaker E3+ SCSI Color scanner
* Four-bay SCSI case with power supply
* Philips Magnavox 19" monitor
* Labtec stereo speakers that sit on monitor
* HP Laserjet III printer with RAM expansion and good toner

Commercial Software - non-games
----
o NVDI 4.11
o Papyrus Gold 3.64 with 4.25 upgrade
o ProCopy ST
o SpeedoGDOS
o XBoot III
o Atari MultiTOS (upgraded)
o CAB 2.7
o CD Font Manager ST
o Extendos Pro
o Extendos Gold
o HD Driver 7.11 with 7.71 upgrade
o Thought - Idea processor (design tool)
o AtariWorks
o Lattice C 5.6
o N.AES 2.0
o Straight Fax 2
o Flash II
o Bird of Prey CD (Floating Fish collection of Falcon stuff)
o Expert Software 2000 Fonts CD
o Bitstream 500 Fonts CD
o Selected Signs Font CD
o Speedo Superfont
o Wercs Resource editor
o Cleanup ST
o CD Writer
o GEMTrade German translation program
o MicroRTX
o ScanX scanner software
o UVK 2000
o Iface Color Resource editor
o MegaPaint CAD tool

Commercial software - games
----
o Steel Empire
o Sky Chase
o Sundog - Frozen Legacy
o Super Sprint
o Arkanoid
o Star Quake
o Lords of Conquest
o Hoyle official Book of Games, Volume 2 - Solitaire
o MegaTraveller 1

o Greg Norman's Ultimate Golf
o Space Rogue
o Dominium
o Radical Race
o Just Another War in Space
o Risk
o Defender II
o Captain Blood
o Dungeon Master
o Dungeon Master Expansion Set #1 - Chaos Strikes Back
o Nine Princes in Amber
o Midimaze
o Red Lightning
o Omega
o Microprose Golf
o Ogre
o ST Star Raiders
o Stellar Crusade

Registered shareware
---
o Paula mod player
o CLA Digitial Circuit Designer
o Thing 1.27
o ANIPlay
o Others, I know....

Other software
---
o Atari Development Kit with all binders and documents
o MiNT installed across both disks
o MiNT 1.12 currently running
o RPM installed
o SSL version of Lynx installed
o Lots more installed freeware...

Books
---
o Best Electronics catalog
o Atari Compendium
o The ST Assembly Language Workshop
o Introducing Atari ST machine code
o MC68030 User's manual (Motorola)
o MC68040 User's manual (Motorola)
o MC68060 User's manual (Motorola)
o 68K programmer's reference manual (Motorola)
o ST Disk Drives
o Atari ST Internals
o Atari ST: VDI

All hardware is in excellent working condition EXCEPT for the native video output of the Falcon. There is a blue tinge that comes and goes. This blue tinge is not present on the video card output.

Nearly all commercial software includes original disks, most include the boxes. Most installed shareware has been registered. No guarantee on some of the older software as far as compatibility is concerned (some of the games have been around since my 1040 STe). Please ask if you have a question about a specific software item (e.g. version, compatibility, etc...).

Total for all items: $2200 US
Total for all items minus optional hardware - $1700 US
(Note that this means you supply your own SCSI case)
Buyer pays shipping

Price is negotiable. Buyer who will pick it up in Ft. Worth, Texas preferred. Will entertain trades (partial or full), especially in firearms or accessories. Payment in e-gold also accepted.

I can be reached via email at michael12@mindspring.com, or you can reach me by phone at 817-427-2129 in the evenings.

Thanks.

5318. Mega ST 4 TOS Upgrade?

Newsgroup: comp.sys.atari.st
Date: 2001-11-21 07:24:46 UTC
From: Atari <atari@qnet.com>
Message-ID: <3BFB56BE.F3F43491@qnet.com>
Source record: 40185

I have a Mega ST4 that had TOS 1.00 on two chips. I replaced it with Mega TOS 1.02 6 chips. I jumped W2 1-2 and W3 1-2 and jumped W4. And also cut a pin un the U12 chip. And now the Mega wont boot. Am I missing something else? There is NO Blitter installed. The chips worked in a 1040STF without any problems.

Any help would be appreciated,

Don

> was not the case with AHDI.
> Am I wrong?.

No, you are absolutely correct. BTW, note that formatting a drive is
only necessary if sectors are bad, in *any* other case partitioning is
sufficient. Formatting usually is a waste of time.
If the ID check of HDDRUTIL (demo version) finds the drive you an be
sure that there are no problems with your hardware as far as issues like
initiator identification, parity etc. are concerned. Remember, however,
that with the Mega STE's internal controller you will not be able to
address more than 1 GB of a drive, even if the drive has a higher
capacity.

execution.

The noticeable lag between click and execution is a ' feature ' of TOS
1.00.

Check your TOS, desktop info, read copyright date. 1985 is TOS 1.00,
'85-'87 is TOS 1.02,

'85-'89 is TOS 1.04, '85-'91 is TOS 2.06, where applicable.

If you have TOS 1.00, switching to TOS 1.04 will vanquish the delay. (
chipset in stock)

It won't show much if any speed increase, NVDI don't work with C-lab but
strangely,

Steinberg Speed-up worked quite well with Notator SL on my Mega
STE.....

> I have a Mega ST4 that had TOS 1.00 on two chips.

Interesting, never seen that.

> I replaced it with Mega TOS 1.02 6 chips.

Ok, so if TOS 1.02 is 192kbyte then these are 6*256k 8-bit ROM's ?
(6*256/8 = 192kbyte).

> I jumped W2 1-2 and W3 1-2 and jumped W4. And also cut a pin un the U12
> chip.

The manual say's....

ROM W2 W3 W4 U12
256k 1-2 1-2 Jumper No Use
1Mx2 2-3 2-3 Non Use
1Mx6 2-3 2-3 Jumper No Use

So it appears you have the CORRECT settings.

> And now the Mega wont boot. Am I missing something else?

Dont think so, you sure it's not a higher TOS and you should have used
the LAST setting (1M*6)?

Or you could get a TOS2.06 on two chips, which is the middle setting.
You can source the chips for (max) 2.99 each.

Hi Peter,
Good point! But let me add that both new hardware and new software are
needed. For instance, CAB lacks Javascript and secure transactions. A
new browser that does all of what CAB does + whatever (to be up to date)
is still needed! Great hardware with limited access does'nt cut it!
However, great hardware could spawn better programs!

It's quite obvious that you have no idea of the current "Atari" market.
Since you are quite uninformed you are certainly not a qualified person to
start any initiatives. If you want to inform yourself have a look at Atari
web sites.

Im sure its not a higher TOS. Ive also tried a 6 chip 1.0 and its still the same. The eproms are 27c256 so the 256k setting should be working. I also have a set of TOS 1.62 but the PROMs have more pins so that option is out.

Thanks,

Don

Which is why I mentioned it, I tried with no success and having Speedup used
that instead.

> However, *older versions* of NVDI, available at the time Notator was
> supported work.

I tried NVDI 2.5.

> Never versions should work as well, provided that it's set up in a
> special way. I haven't gotten round to trying out all of this yet and

NVDI 4? seemed to work with Notator Logic but don't quote me.

> > but strangely, Steinberg Speed-up worked quite well with Notator SL on
my Mega
> > STE.....
>
> What's this? Never heard of "Speed-up" before.

I have mentioned it before. It seems to improve the mouse responce with TOS
1.00.

> I gather it's some sort of equivelant to NVDI, Warp-9 and what have you.

Seems to be.

> Is it a commercial program?

It's by Steinberg so I would think so. I'll check.

Barrie.

I forget the name of the program that will do this (can anyone else help with that?), but .ST files are disk images that must be turned back into disks.

> Also, is there a way to quit any running program and get back to
> the desktop?

If you only use TOS, I don't know of an easy way other than using the "Quit" or "Exit" option built into the program, usually under the "File" menu. However, if you use a multitasking OS (Geneva, Magic, MultiTOS, NAES, etc) then there is usually a list of running applications that can be accessed and used to terminate problem programs.

> One last question, does anybody know where I can get a copy of
> cubase?

Try asking here and looking on E-bay for anyone willing to sell you a second-hand copy, otherwise, contact your nearest Atari dealer and see if they know where a copy can be ordered from. The program has been discontinued, but there are certainly used or unbought copies floating around out there.

>Jared,
>There is the Tempest, the Coldfire-powered Pegasus, the G4 bplan board...

Ah... you mean this?

Pegasus and MagiC(6:00PM, July 16/01)
For all of you optimists who are still looking forward to the Pegasus project, the chances are that MagiC will not be available for the machine, even if the machine itself makes it to the market. The author of MagiC has, in the past, had negative experiences porting MagiC to clones - usually selling relatively few licenses. Further, many people are happy to hear that the machine will more than likely be MiNT based, although the future development of N.AES is still cloudy.

And, let's not forget...

Dessee (5:00PM, July 21/01)
If the Pegasus project ever comes to light, expect the powerful DEESSE DSP audio card to play a key role in its production and marketing. The two companies, Frontier Systems and Medusa Computer Systems, have apparently come to an agreement which will allow them to work in close cooperation with each other. The announcement has been posted on both companies web pages. Further details of the deal should be released soon.

And, if I read the G4 bplan page correctly, I see no Atari-compatible support anywhere. Odd.

>It's quite obvious that you have no idea of the current "Atari" market.
>Since you are quite uninformed you are certainly not a qualified person to
>start any initiatives. If you want to inform yourself have a look at Atari
>web sites.

It's also quite obvious that two of the three references are not in production yet (and may never be) and the third is not even directly Atari-related. NEXT!

As stated before you are uninformed. bplan/Merlancia have the TOS sources
now, the xtos computer will be produced and the Tempest card is also not
dead. I should know it because I was at the recent Atari fair.
And if I remember correctly you neither have a production plan nor anything
else besides weird ideas so - NEXT.

Does it die on the Unix side or on the ST side? It's possible that your serial connection is not 8-bit transparent. Zmodem is supposed to be smart enough to work on even 7-bit connections though. In general, Zmodem is the best solution for this problem. Which versions are you running on the ST and on Unix?

Source record: 40103

Hello there. It's been at least two years since I've done any serious work on
my Ataris but I've just now upgraded to the current SpareMiNT distribution
and brought my development environment up to date. In addition to getting the
CAB overlay code updated, I've made a couple more small improvements:

Since so many people didn't like the "POST got Redirected" alert box,
there is now a cabovl.cnf option to just automatically issue a GET on the new
URL.
I never got a stable setup for spawning the external gzip program to decompress
incoming text. Instead, I've integrated zlib1.1.3 into the overlay directly. This
allows much faster download of HTML pages on servers that support it.

The full distribution (source code and 68030 executable) is on my web site at
http://highlandsun.com/hyc/ovl186.tgz

If you need a 68000 binary, email me. I haven't built one yet but can do so if
needed. I haven't been on these newsgroups in quite a long time and I doubt
I will have time to pay much attention now either, so email is your best bet.

It's worth repeating that if you are buying or selling items here then give
a clear indication
of your location, continent, country, town etc.

There may be someone just round the corner who has or needs the same item.

5344. N.AES2/THiNG english .rsc ?

Newsgroup: comp.sys.atari.st
Date: 2001-11-22 12:37:39 UTC
From: nospam@zonnet.nl
Message-ID: <nk6L7.19007$LK4.72781@zonnet-reader-1>
Source record: 40113

I have updated my N.AES from version 1.2 to 2.0.
I took me quite a lot of time to figure out what caused my installation to fail at first. The GEM-installer should make things easy but I didn't have enough space left on my C: drive
for a double 1.2 + 2.0 installation and I didn't want to overwrite my old setup completely. I wanted to keep my English THiNG resources (my 2.0 is in German) and my old desktop settings.

But THiNG wouldn't work properly. But now I have found out that I had to replace my old english THINGTXT.RSC with the new german THINGTXT.RSC from N_AES 2.0: I examined the files in a resource editor and found out that the one from 2.0 has 237 alert/text objects whereas the old one had 235. This little difference gave me a lot of trouble. It looks like there are several different THiNG 1.27 versions: I have one from N_AES1.2, one from N_AES2.0, and an unregistered shareware version, and they all are very slightly different. Correct me if I'm
wrong. My english THING.RSC file works OK.

At this moment my system is a German/English mix. Does anyone know where I can find complete
english resources for both N_AES 2.0 and the THiNG 1.27 version that came with it ? I've seen
it somewhere, but I can't remember the URL (ftp or http).

5345. NDIALOG

Newsgroup: comp.sys.atari.st
Date: 2001-11-22 12:37:41 UTC
From: nospam@zonnet.nl
Message-ID: <pk6L7.19008$LK4.72781@zonnet-reader-1>
Source record: 40114

If I understand well NDIALOG is a memory-protect-compatible replacement for WDIALOG to be used with MiNT/N_AES.

But I know very few programs that really use WDIALOG. One of them is fontname.app that I got with NVDI. But I get some ALERTS first warning me for illegal AES calls (or something like that - it's in German) before the program starts. That's better than not starting at all
(which happens when WDIALOG nor NDIALOG are installed) but still not very good.
Another program is Porthos. But this also starts without NDIALOG now, and I don't see any difference with NDIALOG installed: I don't see any extended print dialog.

Does anyone know a program that needs WDIALOG and works just as well under NDIALOG, and that can demonstrate the extended possibilities? I haven't seen anything of the dialogs that I saw in the N_DLG.RSC file in my resource editor in action yet.

The way the things are now I don't see much benefit in installing NDIALOG.
Or am I doing something wrong ?

5348. K�ln 18 november 2001

Newsgroup: comp.sys.atari.st
Date: 2001-11-22 12:37:46 UTC
From: nospam@zonnet.nl
Message-ID: <uk6L7.19011$LK4.72781@zonnet-reader-1>
Source record: 40117

As you see I'm suddenly asking a lot of questions in this newsgroup.
This may have been caused by my visit to the Atari floor on the AMIGA 2001 messe in K�ln, Germany.
It was nice to see the faces of some people who's name appear on this newsgroup regularly.
It was promising to see that the Atari community may not be very big, but still very
active and alive. This inpired me to, when back home, play and experiment with my Falcon with
all kinds of MiNT/N-AES/THiNG configurations - giving me a lot of fun but also a lot of crashes.
Not because Atari software is unstable, but because Atarians, like me, are adventureous
people.

There is one thing I saw that could well be typical for our future :
I have hardly seen any "classic" Atari computer on the stands. I've seen Milan's, MagicMac,
STemulator but no good old ST's or TT's in action.
Thus it's not Nostalgia that keeps Atari (with or without the name) alive !! (But don't
throw
away your old ST anyway)

Martin Tarenskeen

bplan (who is Merlancia?) has the TOS sources? Aw, $h|t! There goes my
last idea...

Anyone want the empty Tandy 1000HX case (80's case designs were the best)
before I throw it out? This whole Atari revival thing just ain't gonna
happen (at least with me involved), so the case I was thinking would be nice
for a new Atari computer is just junk on my shelf. Let me know by Saturday
if anyone wants it.

Well, I guess it's back to working on my animatronic lion, getting him sewn
back up and restuffed (I had to tear him open to replace a stripped servo)
and using him to test out some new animation software/hardware.

At least $10,000.00 from my mother got my most important dream realized (the
animatronic lion). I guess being a computer company CEO just isn't in my
destiny. But God knows best, so who am I to try to change it otherwise?

Christian things are always more productive anyways...

Latre!

Keep your eye out on www.atari.org as this is where new releases and news concerning Ataris are. I didn't used to bother until recently, but it is very useful. I also get to know a little o what is happening on in the 8bit world, just check out the doom screenshots on an 8 bit Atari. They look amazing!! TBH, you need a more powerful Atari to get the most from the software that is available. You could be running Magic or a Mint setup, all multitasking OSes, not forgetting Geneva.

Read through http://www.myatari.net as well to see what people are up to and read reviews on new products and good articles.

Hi Peter,

Unlike some other developers Rodolphe frequently keeps his
customers/potential customers updated, and contrary to what have been said
in this newsgroup he is very supportive in every way. I have bought stuff
from him, and he has helped me a lot. Have a look at his webpage instead.

Regards

/Peter the second

If the sluggishness seems to be only with the Creator/Notator program -- I recommend you thoroughly clean the contacts of the dongle (Hardware Key) and mating receptacle of the Atari.

These contacts can oxidate over time and create strange behavior. A long shot but worth looking at.

Make sure you power down before removing, cleaning and exercising the dongle.

JamesBRey@aol.com

Sounds like fun. Just for the record, I still have two TT030s, two Falcon030s, a 1040STe and a Mega4 ST. The only ST I got rid of was the 1040ST that I traded in when I bought my Mega, back in 1980-something... All of these guys still work, although one of my TTM195s is now dead. Maybe I should get the TTM field service manual...

It would be nice if my Ataris were faster, but mainly I just use Unix workstations...

Hi Jared,

>After much consideration and insight from Dennis Vermiere (sp?), I've come
>to the conclusion that not only is Infogrames dedicated to the Atari name,
>but that they wouldn't be willing to consider licensing the name because of
>a multitude of other considerations.

Good... but why is it always me that has to open our eyes? You were told so
repeatedly by others, but ignored them.

>If Atari clones are to revive and continue on, to a selfsufficient
>sustaining degree, they must reinvent themselves as the ultimate *source*
>from whence they spring forth. In other words, we must do what the PC clone
>makers did in their early beginnings. Without this, I see little but failure
>once again. Are we willing to commit to that level? I am, where I can.

NO NO NO !!
Before you get all windup and over-enthousiastic again forget all about yet
another attempt to create another Atari clone...
The big difference with a PC clone maker is the sofware base. All one needs
to do to sell heaps of PC clones is build a decent machine and sell it at the
right price, the computers will sell on the strenght of their software base.
The average PC user doesn't really care who, how and why the computer was
build, all he cares about is that the PC programs run on it.
For an Atari clone it's the opposite, there isn't any software at all that
exploits the power of these machines. Someone buying a clone is able to run
his existing apps faster, but that's it. For some people this might be all it
takes to upgrade, but the majority will say that it's not enough.
I'm fed up repeating this: the very first thing that needs to happen is some
amazing software appearing, and preferably software that can't run on the old
machines but requires at least a 68040 and graphic card...

Cheers from Belgium
Dennis

Hi Jared,

>If you have no hardware, with what reason should they write software? It
>truely is a chicken 'n egg scenario. Who comes first?

That question was answered when the Hades and Milan were released, it's
not a chicken and egg situation. The chicken is present, it's these damned
eggs that are missing...

>*Money* and *cooperation* would solve this whole problem. Never forget
>that.

No way...
1. You haven't got the money
2. Even if everyone here would participate in your project and would be
crazy enough to put $1000 towards it, you still wouldn't collect more then
a measly $100,000 and that's a very liberal estimation.

Unless you know the secret to turn $100,000 into a couple of millions, all
you do is waste our time.

>But you're right... it's pointless to live in the Atari past when there
>is so much future in the PC arena... and even more so with the Power
>Macintosh G5's coming out soon!

???
Don't put words in my mouth please. I'm not the one who's using a PC and
left this platform. And I am certainly not the one who starts drooling
whenever PC's of G5's are mentioned. I start drooling when 68060's are
mentioned... :-)

Cheers from Belgium
Dennis

No, the weakest link is usually..... the user.....

> Very annoying that it's needed at all.

My ten pennyworth.... This gimme gimme gimme thing really annoys me.

If software writers want to make their product freeware that is up to them
BUT...

Notator and Cubase are still widely used commercially. (Yes, they are!!!)

I fully support the continued ' dongling ', but then, I would, wouldn't I.

> Notator isn't even sold..... (I have Notator in stock...)

There are users who paid a lot of money for their copy, do you want them to
present you all with free gifts?

> ....or supported by its makers any longer,

It don't need support, it does what it does, what more do you want?

Just get on with making music!

That is why you want Notator.....isn't it?

> Are you planning on having him eat you?

He's a Christian lion, so he wouldn't lower himself to that carnal level.

I based him on a copyrighted pre-existing stuffed lion and his "look" didn't come out right after modifications for animation, as well as the fact that he is simply too small to be anything but a host PC driven unit, so I've gone with a much larger, generic stuffed animal to animate.

I will probably sell him with his software on eBay eventually, for around the price it cost to have him made. He is definately unique (he's a prototype)... *and* interactive (with proper programming). I also have a VHS video of him in action. Need to get it copied and maybe I can help sell him by others seeing it.

Sure wish there was an animatronics newsgroup I could spout all this stuff in...

Jared

Hmmm... I purchased Notator for $600 many years ago. Since then I have purchased two additional copies, as well as upgraded to Logic, etc...

THE DONGLE INTERFERES WITH MAKING MUSIC.

I can't tell you how many hours of work that I have lost because the computer froze when the software went to check the dongle on a disk access. It is one thing if the copy protection is transparent, and another thing entirely when it interferes with the operation of the software.

Aloha.

Totally agree with yourself an Hallvard here. I too paid around the same price years ago (no problems at all with that!) but the timing checks relative to the dongle make it quite unreliable - shows up _any_ problems with cartridge ports etc. Especially as they are not interested in replacing or investigating problems with it. I had a nightmare situation a few years back with my Steinberg D-50 Synthworks dongle (brilliant editior) which decided to fail and they (Steinberg) just couldn't care less. Fair play to the programmers to try to protect their hard earned projects _but_ this software is a *large* investment and is ruled totally inoperative without the dongle. You've paid for the software *not* the dongle - you shouldn't even have to be worried about that issue. Interestingly, the Cubase dongle I've never had a problem with whatsoever.

Regards
KapMan

> list without having gotten Emagic to change their minds about releasing
> it as freeware).

Maybe not freeware, but what about all owners who purchased and have
dongles to be able to send these in an get a non dongleware program? This
way only legitimate users would own it.

Regards
KapMaN

Operative word ' purchased ' methinks.
>
> THE DONGLE INTERFERES WITH MAKING MUSIC.

No. I used Notator on a Mega STE with very little trouble

Lack of maintenance is the problem, as long as the dongle is in clean and
tight it works.
The machines are now over 10 yrs old, look after them and they work.
I know this 'cos I fix them.

I could always hard wire the dongle to the mobo for you.......

> ......Especially as they are not interested in replacing or investigating
problems with it.

They being the dealer or Steinberg?

> Fair play to the programmers to try to protect their hard earned projects
but
> this software is a *large* investment and is ruled totally inoperative
> without the dongle.

The whole point of having a copy protection key.

> You've paid for the software *not* the dongle -

A common misconception, you buy a licence to use the product.

> Yes, as a salesman I can see your point of view. However, for the user
the dongle provides its fair share of problems,

I got into fixing Ataris by using the software and still use both Notator
and
Cubase.

Seems the biggest problem is having to buy Notator instead of just
freeloading it......

>drowned you at birth.

Just egging me on, aren't you? For your information, I am VERY glad to be alive and to have my Christian animatronic project to fall back on after my failed efforts here. Thus, I have no reason to say such silliness to her.

Now, would you please stop replying to my messages and let the whole issue be forgotten, so people can go back to their normal lives? As soon as I see that none of my messages are being replied to anymore, I'll grow bored and unsubscribe from this newsgroup. Shouldn't take more than a couple days. I've already unsubscribed from the other Atari newsgroups. This is the last one! Really!

You want me gone or not? *sigh* Clueless fudge-packing dickhead. Can't keep your mouth shut long enough to see me go away. At this rate, I'll NEVER leave!

Whatta mattuh... your brain suffering frostbite these days? Doesn't take a genius to figure out that ignoring me and my messages will get rid of me a lot quicker than not.

Betcha can't resist replying to this message... you'd probably die of bordom without me, right? But, then again, how'd you ever survive while I was away since my last visit months ago?

Jared

I have one called CZPHONIX. Unlike many other old and free Atari midi software
(like my YSEDITOR for Yamaha synths) it uses clean GEM windows and menu's and
it runs on my Falcon with MiNT/N.AES.

I've personally always looked after these dongles like they were rare gems!
:-) but have found the Notator one is not great - I'm sure other Notator users
have found this too. By the shear act of connecting and disconnecting
dongles wears things out. There are ways aroung this - key ports and stuff,
but then again as Hallvard has said, Notator can be unreliable with those.

I guess having to repair/replace cartride ports and dongles may help your
finances but it's not the point here.

>> ......Especially as they are not interested in replacing or
>investigating problems with it.
>
>They being the dealer or Steinberg?
>

Yes, Steinberg.

>> You've paid for the software *not* the dongle -
>
>A common misconception, you buy a licence to use the product.
>

Of course....a licence to use the product and not have it's use interfered
with by a over zellus copy protection. You haven't had this problem so good
luck to you, but it's obvious others have as why would you have to repair
them otherwise if this wasn't an issue?

>Seems the biggest problem is having to buy Notator instead of just
>freeloading it......

Hmmm, I don't think Hallvard is saying this at all as he's obviously
already owns a copy - I think he's mainly concerned of problems caused by
the timing of the dongle in relation to trying to expand his system setup.

I agree with Hallvard and John as Notator is the best sequencer program
I've ever used and it's just a shame it's reliability is hampered by the
dongle. I've even spoken to experts like El at Atari Workshop previously
about this aspect and he said he agreed that they (C-Lab) made the timing

too tight - it could have been done a lot less fussy yet still retain
copy protection without problems.

What do you mean with "SCSI program"? What is such a program intended to
do? Note that for each device designated drivers are required in order
to access this device. You can use software like DISKUS, however, to
directly send SCSI commands to a device. But this only makes sense if
you are a SCSI expert and have something particular in mind with respect
to this device.

ICD did a SCSI test program, it sent commands etc to the drive.

It may be on the net somewhere but it is a commercial prog......

> Also, has anyone successfully gotten a Sony CD drive to work with an
> Atari computer?

A Sony CD rom yes, many times, using one now but it probably depends on the
drive and software.

I always used ICD pro and Extendos Pro. My thanks to Roger Burrows.

Atari Portfolio in perfect condition used once. Have all manuals etc in
original box.
(I see reconditioned ones for $175 $189 . Mine is as close to new as you can
get!!!)

interfaces for paralell and serial port plus original Atari card and a
fax/modem card

also available:
I Megahertz PCMCIA 28.8 fax/modem card also used once only.
(Not positive but I think I can locate the cable for it. Otherwise they are
obtainable.)

PCMCIA card reader/writer for a PC.
Works with 1 type III or 2 type II cards It us new in original box asking
$150.

I will accept best offers

Thank
you Neil Sheppard

I'd be more than satisfied if the adapter could provide me with SCSI-1. My Adaptec 2940 SCSI-2 card in my PC will do the rest as has been succesfully tested by making backups of a Mac SE/30 here (has an external 25-pin SCSI-1 connector). Backward compatibility rox :-)

Cheers,
Martijn

There is also a utility floating around, which reads the contents of a
ST or .MSA disk image into a RAM disk. Works very well so long as
there is a file system on the imaged disk

> chip.

If the chips worked in another computer as you say, then it is probably some trivial mistake, becaue it appears that you have done -everything- just right (I assume that you cut pin 12 of U12). So I suspect something like a lost contact on a chip pin, misplaced chip or jumper, or somethng silly like that. E.g. I had once a problem with bad contacts in sockets for ROM chips. It was found out that eprom-chip pins themselves has oxydised sufficiently to lose contact. Maybe you should look at the schematics and check with an ohmmeter if you have all the connections relevant to ROMs exactly right.

>> You can source the chips for (max) 2.99 each.

Unfortunately it not as simple as that because, although it would be possible to install chips containing TOS2.06 in the six sockets, the address space reserved for chips in these sockets is is not sufficient so 256KB TOS 1.6* and 2.* can not use existing chip-select circuit in the glue.

Hi Al

I have found the Caged Artist series good, but it looks like you want
something more! It seems like you have the main program XOR. You can
get all the profiles you want for it from the MOTU web site on the PC
download section.

http://www.motu.com

To use them in XOR you just need to rename the extensions: profile to
.xor and the help file to .hlp and copy them to the same dir as
xor.prg. Then run the Setup.prg and install your new profiles. The run
xor.prg and there you have it!
BTW: The caged artist version (CZ-Rider) is compatable with XOR.

There might be some more Casio editors for Atari as well on the
Atari-MIDI archive site under SOUNDS. Check my site for the links.

Yes and he should also check that all the pins of the TOS ROMs are
actually in the sockets! When I upgraded my STFM to TOS 2.06 I had
intermittent problems, and on checkling found that some pins had
not gone into the socket but had been bent over when inserting the
chip, though they still touched the top of the socket and usually
made contact. Pulling out the ROMs, straightening the pins and
replacing them more carefully cured the problem.

I like you too. You've always been my biggest supporter.

However...

Forgive me for asking, but... was that a sarcastic reply or a serious one? Sometimes a reply can be so generic as to the way it can be taken, it's hard to tell how it was meant. :-) And, considering how few actually agree with anything I've said in the past weeks, I sometimes grow suspicious of everyone after awhile.

Hi ALL:

Finally Updated my KCS page with links to Tim Wilsons Excellent Open Mode Tutorial. This is an excellent article and if you have not checked it out...NOWS THE TIME!

I have also put in Tronds History of KCS as it was pretty clear. Thanks Trond!

I also have a new link to the Midi Recording Studio Manual in PDF format. Actually, there is a story with this. I was asking for any Dr T basic documentation and a person answered me and created one...but it was the wrong one! he did it for MRS (Midi Recording Studio) which is an entry level sequencer to KCS (correct?)However, I believe you can still use parts of it for KCS. Check it out anyway. I am very thankful however, as we still can't get a downloadable version of Dr T basic.

I also put in my part about using Open Mode and the Mmouse.all file which I created using Music mouse patterns (Laurie Spiegels program)So have fun with that as an Open Mode Play.

From: vdjole@EUnet.yu
Message-ID: <9tqna5riq1@news.eunet.yu>
Source record: 40093

Hi all;

Recently, the number of daily postings in this newsgroup has about quadrupled. I would welcome such an occurence, had it not been due to overzealous efforts of a single person. I agree that he is almost completely uninformed of the state of the Atari scene and that his repetitive posts on the same irelevant subject (Atari -name-) has become boring beyond imagination, but still we should all try to calm down and not resort to personal insults. At least some of us pay internet by the hour, and I at least do not find it funny to pay for tens of messages containing nothing but noise. I am not offended or blushing because of the foul language, but the information content of those messages is zero. And it is not even easy to use message filter, because Jared cunningly changes the subject every now and then and, and even replies to his own posts under a different name, and one would have to adjust the filter every couple of days...

To Jared:

Relax. Take a deap breath. Don't say anything. Go to a vacation for a couple of weeks. Have some fun with your wife.

When you return, re-read what people have been replying to your posts. Think about what they said, most of them said what they did with good intentions and from experience. Then find yourself an AtariST computer. Try TOS 2.06. Try Mint. Try Magic. Try Geneva. Try modern desktops. Try some more-less recent applications (e.g. Papyrus etc). See how much or how little all that has travelled away from the simple TOS1.0 on a 520ST. Then try to get a more powerful Atari (TT or Falcon), or find someone who has an Atari clone. Compare your personal experience with the performance of clones. Then try an emulator or two. See what is good in them and what is not. It doesn't matter that the clones and emulators don't conform to your dream- find out personally what is really there. Don't complain that you can't afford all that- if you are serious about re-creating a computer brand you should be able to invest at least in a couple of machines and several software titles.

On the hardware side, inform yourself of the established upgrades that exist (or existed) for the Ataris. See what improvements those add-ons brought, and what did not. Get acquainted with someone who develops electronic hardware. Find out how much money and, even more important, work, time and equipment is needed to develop a product with the complexity of a computer. Re-think it all over. Go fishing for a couple of weekends.

After you have done a decent research (my estimate is that it should last a couple of months) and thought about it, THEN come with new ideas. And if someone replies with well-intended critic, don't say you are finished and then come back fifteen seconds later with another half-baked idea. Think.

Regards;

Yes, that was the one that was mentioned to me. I did download the
Gemar archive, so I will see if the program helps or not.

Fine. But who is going to do this? Certainly not me. I have no
programming ability. I am only able to offer supposedly misdirected and
sometimes hated inspiration to a cause.

If no one does what you say needs to be done, then there utterly is NO hope
at all. If those in the Atari community, who CAN program the superior apps
required to motivate the cause, do NOT program those apps, what hope is
there?

What in blazing tarnations is "MorphOS"? As though we don't already have enough TOS-compatible OS's already. And, as Dennis has already stated, withgout the software to take advantage of these new powerful systems, they're just about dead in the womb!

If everyone stops replying to the posts of which I started the topic of and went on talking about what they WERE talking about prior to my interruption (revisit), they would soon find that I am gone.

Shoot, I don't even know why I am still here... probably mostly out of curiosity to see if Steve Sweet or someone else will reply with something interesting to then continue the brigade. Afterall, if I unsubscribed to this last Atari newsgroup today (don't everyone urge me on too heartily, now), there might be a reply I would have found worth while to reply to.

You need not worry, my tirade is over. Dennis has pointed out the necessity for which all here, that can, must follow, and that necessity is not something I can do at all, so it is pointless for me to go on blathering about the Atari brandname blah-blah-blah-blah, etc. et all.

>To Jared:
>
>Relax. Take a deap breath. Don't say anything. Go to a vacation for a

Were that we had even the money to buy groceries much less go on any sort of trip, I would... uh, go on a trip with my wife, that is. Don't say

anything? Aw, shoot. I spoke. But no one needs to reply... really! The less people reply to my posts, replies, and topics I started, the sooner everyone can see me go the way of the dodo... at least as far as this newsgroup is concerned.

>When you return, re-read what people have been replying to your posts.

>personally what is really there. Don't complain that you can't afford all
>that- if you are serious about re-creating a computer brand you should be
>able to invest at least in a couple of machines and several software
titles.

You have to realize something... I've been there/done that, as far as the Atari1040ST, Mega ST4, and Falcon030 are concerned. As for the clones... can't get one here in the states to try and, really, haven't the money to buy one anyways.

If I could do everything I can do with my PC, on an Atari clone, plus feel that the machine I owned was still being improved, supported ,and had new software coming out for it (look at www.bebits.com for proof that even a "dead" OS (BeOS) can have programmers still working towards it's future... we're talking hardware drivers, apps, and utilities galore!), then I would gladly own such a machine.

If the Atari scene had this kind of support, I would gladly own one again. However, I do not use BeOS either. Why? Because it's future is uncertain (has been for well over 1.5 years) and it hasn't got a browser to enable me to go anywhere and everywhere on the Internet (Jave support and such) or play certain sound/video files perfectly, etc. Windows 98 does. And the Mac would (if I owned one).

The Atari community is a fraction of the BeOS community and I am involved in neither. Nostalgia drove me to discuss the impossible in the Atari scene. But little to nothing will drive me back to the BeOS scene... until either BeOS is licesed by BeUnited or OpenBeOS is actually a working clone of BeOS.

And the future is uncertain down both those streets.

>After you have done a decent research (my estimate is that it should last
>a couple of months) and thought about it, THEN come with new ideas. And if

>someone replies with well-intended critic, don't say you are finished and
>then come back fifteen seconds later with another half-baked idea. Think.

What new ideas? Everyone knows what I believe must be done and what I now realize is the situation. Do you really think my opinion of how these things ought be done will change regardless of the time taken away? Not likely.

No. My time here is at a close. The future of Atari and/or the TOS community I desire will probably never happen. If software drives hardware and no one writes the software... it's just hot hardware with no future.

Besides, I have a more Christian ambition I need to get back on track with. I've wasted enough time (mine and other's) here.

So, please, DON'T reply to this message or any part of it! DON'T reply to anymore of my other messages! DON'T reply to anyone else's messages that have anything about me or my topics in them!

Do this for at least a week (starting Monday) and you'll be rid of me once and for all...

Sound good?

"Excellent! Flawless victory!"

After a bit of consideration, I have decided to unsubscribe from this newsgroup. I have wasted enough of my time and others, as well as annoyed a few too many over matters seemingly only important to me.

Feel free to discuss over past topics as you see fit or berate me as you like. It may be helpful in the former, because I have set a portion of this communirty ablaze with topics (to which one or more of you may agree or disagree and discuss to a positive end), and pointless in the latter, because I will no longer be monitoring this newsgroup.

I wish the Atari community well (yes, even you, Steve Sweet, you volatile little rodent! (grin)) and hope that, should I peek in at a later date, the discussion speaks of new systems and software that make wanting to own a TOS compatible system truly worthwhile.

My intent was not to anger or upset, but to spark and envision. Perhaps I was wrong in my dogmatic views and deserved the replies I got. Either way, the end is the same. I am no futher along than I was when I came back. I can only hope that, perhaps, I have opened up thoughts and ideas and topics and conversations that would yield a future that I still do not, yet, see (but would love to) in the Atari community.

It's been fun... but I have needs be elsewhere with another project that requires my attention.

Fare thee well... I am now gone.

Jared

Medusa will ship a Hades060 to your front door. It's simply a matter of how bad you want something. I do not wish to debate the 'brand name' issue I just want to be sure everyone here knows that Medusa will ship a clone directly to an individual apon request. That is how I got mine.

But Knife does not get along at all well with hard disks, specially with large partitions. Don't think it caters for LFNs either. It's fine on floppies There is an UNDEL.TTP (awkward as you have to enter the full path on the command line) as well as an UNDELETE.PRG which offers its own file selector of sorts; however that tells me I don't have enough memory when I start it - on a 14 MB Falcon!

There's also a rather good undelete in Diamond Edge, but unfortunately that does not like large partitions of LFNs either :-(As it reports nonsensical results (negative values!) for partiton sizes with my 840 MB partitions, I wouldn't trust it for undeleting.

Regards, /Peter/

DISKUS does, but note that it is German only, see
http://www.seimet.de/atari_english.html.

Also note that DISKUS can only undelete the short name, but afterwards
you can simply rename the file to get the long name back.

The "Tabby" graphics tablet works on both the ST and Falcon, it pulgs into the Modem port and uses the GEM mouse routines, therefore if Cyber Sculpt uses its own mouse routines it won't work with that program.
You should also note that the one I have came with a 9 pin D connecter, this will plug directly into the Falcon, however you will need a 9 to 25 pin adaptor to use it on an ST or visa versa if older versions were fitted with the 25 pin connector.

Unfortunatly I don't know where you will find one as I purchased mine second hand from a private seller.

5457. [NEW]PS/2 interface for Atari: Keyb and Mouse

Newsgroup: comp.sys.atari.st
Date: 2001-11-27 08:57:32 UTC
From: Laurent <Laurent.favard@NIETSPAM.libertysurf.fr>
Message-ID: <3C03557C.B1C453D3@NIETSPAM.libertysurf.fr>
Source record: 40034
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi all !

I very happy to say, that i finished a full public realease
of a small interface PS/2, which allows to connect a PS/2 Keyboard
and a standard PS/2 mouse (With 2/3 buttons) or enhanced PS/2 wheel
mouse. (News keys are usable, as Win left...)

The board is very small, only 35mmX48mm, and can be embedded directly
into a Atari machine or as external adapater inside a small box.

This one only need a driver for remapped "special" keyboard keys,
as with the Adaptakey from Oxo compagny (for example, the key +=);
mouse don't need any driver to work immediatly as with a standard
atari mouse.

But, a new driver is currently worked, will allow to get the same
behaviour that the from Oxo, to remapped the keys, and get the mouse's
wheel running.

Because i have now a full interface running and already connected to
my Falcon, i can let you the somes prices:

Internal release (for mother board keyboard connector): 250 Frs-38 Euros
External release (with RJ-12 connector, for Mega ST/STE/TT): 290 Frs-44
Euros

I expected to get more informations as soon as possible,
about the driver...

Laurent
(Sorry for my very poor english...)

5460. Q: Atari SCSI HDD to PC?

Newsgroup: comp.sys.atari.st
Date: 2001-11-27 11:15:12 UTC
From: emil.prpic@inet.hr
Message-ID: <3c0370ba.17187976@news.tel.hr>
Source record: 40029

Hello, everybody!

This is my first time visiting this group. I'm sorry if my question is "look, yet another lamer with the same question" but I haven't found any thread of a similar topic in this group.

So, I still have my old Atari 1040 STfm (german TOS, very early, 1.0something I think, 1 MB, DS internal floppy). Some time ago, I've bought an ICD Link 2 SCSI host adapter (basically, it's a cable that connects to my Atari's AHDI hard disk port and on the other side there is a SCSI controller inside a big (SCSI-I type 50-pin) connector that plugs into an external 100 MB Quantum SCSI hard disk. Everything is working fine, I'm happy.

My question is - would it be possible (since it basically is a standard, normaln SCSI hard drive) to connect this HDD to a PC wih SCSI host adapter running under DOS or Win95 (naturally, disconnect it from Atari first) and - with help of some software on the PC side - read/write files directly from/to it. That is - I know that it WOULD be possible IF the software (a driver, a standalone program, whatever) that makes Atari format readable to PC existed.

Well, has anyone tried this? Does such a piece of software exist? If so, could you please give me the URL, or, if reasonable, E-mail it to me, or put in some binaries group, or whatever.

The reason I ask for this is that I see this as the fastest possible way of transferring data and software to my Atari - I surf the web via a PC (Atari has a 19200 bps limit on its serial port so I think this is reasonable, don't you think? :-)).

Thanx in advance,
Emil

> is reasonable, don't you think? :-)).

You can also transfer files via printer port using PARCP and rech 30kb/sec speeds (I had that on my STE, but it almost depends on the PC speed, in my case ST couldnt go faster). PARCP also allows files transport berween 2 ataris.

There is also program called GHOSTLINK that allows you to map PC disks on ST (you can acces them like any other patritions on ST) but it uses serial port and reaches 2/3kb/sec on ST.

If you want to read ST partitions on PC you can use LINUX, becouse it has support for ATARI partiotion scheme. I didn't tested it so I cannot say If it works. I suppose that you will have to recompile LINUX Kernel.

Other way is using ATARI emulators on PC. IIRC GEMULATOR can read ATARI disks, and MAGICPC too (but I'm not 100% sure).

Fortunately this is simple. Just partition your drive on the Atari with
one partition that is both TOS and DOS/Windows compatible. You can do
that with HDDRUTIL (http://www.seimet.de/hddriver_english.html). You can
then read/write data from/to this partition without additional software
for the PC and without additional software, except HDDRIVER, for the
Atari.
Note that the Atari cannot boot from such a partition, though.

Jared:
Thank you for your continued interest in the Atari brand. As you know from our previous correspondence, we have reinvented the Atari brand and have brought it back into the marketplace with three inaugural titles: Splashdown, Transworld Surf and MXrider, with more to come.

As for a name change, while there have been rumors to that effect, we have not made any corporate announcement on the subject. Unfortunately, that limits what I'm able to share with you.

Thank you for your interest.

Sincerely,
Nancy Bushkin

Hi Emil

| This is my first time visiting this group. I'm sorry if my question is
| "look, yet another lamer with the same question" but I haven't found
| any thread of a similar topic in this group.
|
| So, I still have my old Atari 1040 STfm (german TOS, very early,
| 1.0something I think, 1 MB, DS internal floppy). Some time ago, I've
| bought an ICD Link 2 SCSI host adapter (basically, it's a cable that
| connects to my Atari's AHDI hard disk port and on the other side there
| is a SCSI controller inside a big (SCSI-I type 50-pin) connector that
| plugs into an external 100 MB Quantum SCSI hard disk. Everything is
| working fine, I'm happy.
|
| My question is - would it be possible (since it basically is a
| standard, normaln SCSI hard drive) to connect this HDD to a PC wih
| SCSI host adapter running under DOS or Win95 (naturally, disconnect it
| from Atari first) and - with help of some software on the PC side -
| read/write files directly from/to it. That is - I know that it WOULD
| be possible IF the software (a driver, a standalone program, whatever)
| that makes Atari format readable to PC existed.

It is possible to connect the Atari and the PC to the same drive at the same time, providing they dont try to share a partition simoultaneously. Uwe Seimet will no doubt be along in a sec to fill you in on the nitty gritty.

| Well, has anyone tried this? Does such a piece of software exist? If
| so, could you please give me the URL, or, if reasonable, E-mail it to
| me, or put in some binaries group, or whatever.

Providing that your HD has been partitioned such that the PC will recognise it then no additional software is required.

| The reason I ask for this is that I see this as the fastest possible
| way of transferring data and software to my Atari - I surf the web via
| a PC (Atari has a 19200 bps limit on its serial port so I think this
| is reasonable, don't you think? :-)).

You could modify your Atari to give a 38400 bps port and smash your PC to bits violently!!.

Yes, I would imagine bad ROMs. If it were the floppy controller then it
would probably not work either way. Could just need them reseating.

It seems that the address I was sent for him in this topic wasn't quite correct - it should have been rgf@rgfsoft.com, I think. At least I have just received a mail from his robot:
and am posting it here in case someone can help him (Richard is the author of the Arthur translation program and the Luna advanced text editor):

HELP

My good old TT has given up the ghost :-(, can anyone help me? I need an ST-RAM card (2 MB) for my TT (daughterboard-TT) and the ST-RAM chips (also 2 MB) that are on the board (socketed). This is really urgent, as all projects run via the TT and due to this I am so to speak "hung out to dry". I would be most grateful. It would be nice also if it was at a reasonable price, perhaps someone has a broken TT lying around which could be used to "make one out of two".

So if anyone can help him, please get in touch!

Regards, /Peter/

I received the same robot e-mail but had no clue what it was about,
thanks for the translation. Sold a perfectly working TT motherboard
a few weeks back for 50 bucks. I hope rgf gets some help and soon,
wish I could have forseen this...

>ataris.

Dunno about less old Atari machines, but my 1040 ST doesn't seem to
have a bi-directional parallel port - actually, it doesn't even
recognise the standard input control lines like "paper out" or
"printer ready". So I don't see how this could work with it.

>There is also program called GHOSTLINK that allows you to map PC disks on ST
>(you can acces them like any other patritions on ST) but it uses serial port
>and reaches 2/3kb/sec on ST.

I know about that one - I've downloaded it - version 1.02 beta of
02/05/94. I have a problem with it - on the PC side it only supports
COM1 or COM2. For some perverse reason of mine, these two I cannot use
for other purposes (don't ask, it's a long story). I'd need to use
COM3 (connect it in parallel with my modem, making sure that I never
power both modem AND the Atari at the same time) because I have a
mouse at COM4.

Is there maybe a newer version of Ghostlink somewhere that supports
COM3/4 on PC. Or can I get hold of the source to patch it myself?

(In case you wonder, yes, my PC is a piece of obsolete junk but
satisfies my needs, just like Atari. :-))

>If you want to read ST partitions on PC you can use LINUX, becouse it has
>support for ATARI partiotion scheme. I didn't tested it so I cannot say If
>it works. I suppose that you will have to recompile LINUX Kernel.

Whoa, whoa... I do have some Unix knowledge, but recompiling OS Kernel
isn't something I'd like to get into. ;-)

>Other way is using ATARI emulators on PC. IIRC GEMULATOR can read ATARI
>disks, and MAGICPC too (but I'm not 100% sure).

Nah... We're talking about 200+ floppies (backed them up on a CD a
long time ago, want them back on Atari HDD now). The times of endless
hours sitting by the computer feeding it floppies isn't something I'd
like to repeat. Ever. As Danny Glover said in "Lethal Weapon" - "I'm
too old for that shit." :o)

Thanx for the tips anyway!

Emil

Is it impossible at all or can we think it could be done loading HDDriver
from a floppy or having MagiC in ROM or else ?

I gather it's your product, isn't it?

Sounds interesting. Some questions:

1. Are you 1000000000 % sure it works with my machine (as I said, a
VERY old, german, TOS 1.0x)? I don't wish to install the demo version
- it is far too crippled to be actually usable (writing only to C:
particularly bothers me) and what if I can't get back to original ICD
driver...

2. You mention Link96 and Link97. The thing I bought from ICD is
called "Link II". It was bought November 1998. It explicitly mentions
some restrictions of their driver on older TOS versions (which is not
important to me, but I wonder whether there are some that, perhaps,
you're not aware of, but still apply to your software as well).

3. The web-site says ZIP and JAZ but doesn't explicitly say CD-ROM. I
have an external SCSI Toshiba 2x CD-ROM collecting dust in my desk
drawer - ICD driver doesn't support CD with TOS that old. What about
your thing?

4. Why do you need my original HDD driver floppy to register me?

5. Payment in cash not smart. What about S.W.I.F.T. bank transfer? You
E-mail me your bank's SWIFT reference ID (or that german thing - it's
called BLZ or something like that) and your account No and I transfer
the money from my EUR account here in Croatia. Unless you cheat on
your taxes... ;-)

That is very strange. I thought *all* 16/13bit Ataris have bi-directional
parrel port.

You can boot/load HDDRIVER from a floppy as usual. It's just that you
cannot boot from the particular hard disk drive that is DOS/TOS/Windows
compatible. From any other drive you can still boot.

Actually no Atari has a full-featured bi-directional parallel port. This
is the reason why you cannot connect a parallel ZIP drive, for example,
to the parallel port but have to use a ROM port interface instead.

If I remember correctly, the truth is something in-between. The parallel port -IS- bidirectional, but not completely- one (I think) of the handshake signals signals is missing, although the data bus is bidirectional. As far as I can remember this was one of the stupidities of ST design, because the hardware needed to make that signal(s?) available already existed on ther board and it was just a matter of making connections.

For that matter, I think that very old PCs also did not have a completely functional bidirectional parallel port, but I think that with them the problem was that the data bus was not bidirectional and they used the handshake signals when it was needed to transfer data into the computer.

A long time ago, I have used a 1040STFm with TOS 1.0 and a Printtechnik scanner connected to the parallel port, so bidirectional data flow to/from ST's parallel port is surely possible. I suppose that the author of the data-transfer software took into account the reality of this port so the software should work on all Ataris.

Netscape isn't at fault here. Send an e-mail to your ISP and ask them to configure their server with the MIME type for LZH:

application/octet-stream lzh

The server will then know what kind of file it is and how it should be handled. When I attempt to download an LZH file in Netscape 4.7 from a properly configured server, a prompt appears stating in part "You have started to download the file filename.lzh, of type "application/octet-stream". | More info | Pick app | Save file | Cancel |. If the server isn't configured properly, the binary data will fill the browser window.

For 6.1, under "Preferences -> Helper Applications" add that as a MIME-
type and add the extension, but without a helper application. After
pressing return, edit the type and specify "save to disc." This _may_
get round the broken servers, but no guarantees.

<snip>

>I guess I'll just have to continue seeing garbage on my screen (in case
>I forget to select "save as" instead of just clicking a link to the
>file.

I sometimes suffer this when downloading .gz or .tgz archives. Some
servers send the wrong type so I get screens filled with the binary. In
those situations, I go back and use "save target as". Thankfully it's
not often I need to do so.

These pins are not connected on the STs parallel port. Instead, the ST
relies on the BUSY pin.

All 16/32 bit Atari machines have a bi-directional printer port. They
were commonly used for sound samplers before the cartridge port variety
were designed.

I thought perhaps you were having trouble with the server hosting your
Atari Launchpad, forcing you to use ZIP exclusively. In the past I had
trouble with PNGs stored on my web space, where the browser window was
filled with binary garbage. An e-mail to my ISP fixed the problem,
although they had to ask me what MIME type was needed since they had
never heard of the format.

As you know LZH isn't that common in a PC-dominated world, so you'll
have to live with the fact that many servers aren't familiar with it.

> I guess I'll just have to continue seeing garbage on my screen (in case

IE5/Mac -- my favorite browser -- has similar preferences, part of the file mappings contained in the Internet control panel of Mac OS. Like you say, there are no guarantees. I tried the download from http://the.zorro.free.fr, and no matter how I configure the preferences for LZH the file goes directly to the browser window like Hallvard experienced.

That particular domain is running under an Apache server, which would take but a minute to configure correctly for LZH. The webmaster could do it himself, too, if he has an .htaccess file, in which case it's just a matter of adding the MIME type for LZH.

5513. info wanted - 520STFM and Mega ST2/4

Newsgroup: comp.sys.atari.st
Date: 2001-11-29 11:02:48 UTC
From: switchblade <xxx@nospam.com>
Message-ID: <sBoN7.2690$Ub4.25159@news.easynews.com>
Source record: 39930

Hello - posted this originall to comp.sys.atari.st.tech but didnt get much response.

I have recently aquired a Mega ST 2 a Mega ST 4 and a 520STFM.

The two Mega ST's need a monitor, so have been unable to test yet.

The 520STFM look like it has a newer TOS version than it should have (its copyright 1989, and the Atari logo scrolls lots of colours).

Questions:

Can i use a ST monitor connector to SCART connector for the Mega ST's so I can view them on my TV rather than source a hard-to-find monitor?

Failing that, can I use a monitor like the commodore 1084s or phillips ? Would it come with the right connector or is the ST one proprietry?

Can I still get the Atari 520STFM upgraded to 1 meg as it is only 512k and some games won't play?

What are the Mega ST's worth nowadays?

Cheers
Switch

One opinion: grab it. I paid USD $258 for mine, about a year ago, show
machine, little used. Another unsupported opinion, with no data: the drums
do not wear out, the wiper blade does. Those are made of unobtanium, but
someone posted the fact that Canon CX are close enough fits to hack up a
bit and use.

Original cost? First laser printer costing less than $1000 USD.

5518. [GAME] New Quake version available

Newsgroup: comp.sys.atari.st
Date: 2001-11-29 16:58:27 UTC
From: Patrice Mandin <pmandin@fr.mailandnews.com>
Message-ID: <jfp5u9.246.ln@127.0.0.1>
Source record: 39935

Hello everybody,

Having a workable SDL version, I decided to test it with a huge program.
So I used Quake (or more precisely nuq, available at
http://www.quakeforge.net). I compiled two versions. One is 68000
without FPU (works with STonX and Aranym), the other is 68020 or higher
with FPU (I can not test it). Video is supported via XBIOS or VDI.
Keyboard and mouse should work. You need a very fast machine. With STonX
and Aranym, I get 5 to 10 seconds per image).

I would like people having non standard Atari (with graphics boards,
accelerators, or clones) test it to verify if it works. And it can make a
good benchmark. I hope returns from the FPU version (specially on
040/060), because I do not know if it works.

About Quake with SDL:

XBIOS:
On [Mega]ST[E]/ST emulators , you get 320x200 in grey levels (4 planes).
On TT, 320x240 in 256 colours (8 planes).
On Falcon/Aranym, 320x200 (TV) 320x240 (VGA) in 256 colors (8 planes).

VDI (avoid multitasking OS and AES, like Magic or Mint):
320x200 8 bits with an equal or higher resolution.
With a graphics boards which provides a 1 byte/pixel mode, it should work.
Use the environmenet variable SDL_VIDEODRIVER=vdi to test this driver.

I do not spread a complete SDL version, because I would like to have a
GEM driver for video.

The archive on my web site is nuq-20011128.zip

I own a working SLM804. It was free. I have a SLM605, but it has problem
with the paper transport. It was free. The quality is good. As I
collector I would pay NLG 100 because it's new (!) in a box (!!!).
Could you mail me the adres of this person if he has more items to sell?

Why you didn't test the FPU version on Aranym ? With STan's native fVDI
driver for output it could be pretty fast.
I didn't tested it myself because I have not correct .PAK (or WAD ?)
datafile :(

If you are in a mood for making software versions for different CPUs, note that it is possible to have a ST/MegaST/MegaSTe/ with MC68000 CPU and a so-called memory mapped FPU, which puts the machine's floating point performance somewhere in the range of an average STonX emulated machine, or make it even better. With a FPU, speed gain in floating-point intensive applications is somewhere between 500% and 1500% .

The game would probably still be of no practical interest for a [Mega]ST[e] owner, because you say that it takes 10s/frame with STonX, and I don't know what are the memory requirements (can it even be started on a 4MB machine?), but I wanted to point out the often-overlooked fact that it -IS- possible to have a MC68000 with a MC68881 FPU and most compilers provide options for creating code for this configuration. Unfortunately, software authors often assume that if one has a FPU than he also has at least a 68020 and uses Line-F FPU access.

5525. Re: info wanted - 520STFM and Mega ST2/4

Newsgroup: comp.sys.atari.st
Date: 2001-11-29 22:42:19 UTC
From: Steve Sweet <stevesweet@freeuk.com>
Message-ID: <1007148699.662.2@eurus>
Source record: 39981
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi switchblade

| Hello - posted this originall to comp.sys.atari.st.tech but didnt get much
response.

| I have recently aquired a Mega ST 2 a Mega ST 4 and a 520STFM.

Lucky you.

| The two Mega ST's need a monitor, so have been unable to test yet.
|
| The 520STFM look like it has a newer TOS version than it should have (its
| copyright 1989, and the Atari logo scrolls lots of colours).

That would be Rainbow TOS, TOS 1.04 i beleive.

| Questions:

Shoot!.

| Can i use a ST monitor connector to SCART connector for the Mega ST's so I
| can view them on my TV rather than source a hard-to-find monitor?

You certainly can, however you must be aware that the "standards" for scart
are somewhat interperated, so you may have to get out the soldering iron to
get it to work, however the lead i used with my Mega STE worked fine after
some surgery on my monitor.

| Failing that, can I use a monitor like the commodore 1084s or phillips ?
| Would it come with the right connector or is the ST one proprietry?

The phillips CM 8833 was probably the most popular choice for an Atari
monitor and will work great with the correct connectors, cant comment on
grannies comode-door.

| Can I still get the Atari 520STFM upgraded to 1 meg as it is only 512k and
| some games won't play?

Some Games will fail with more than 1 meg, carefull not to shoot yourself in
the foot, more memory will be great for word pro or art work.

| What are the Mega ST's worth nowadays?

They are priceless if you aint got one. 8-)

--

Regards from STEve & his nice warm cosy PAK'd MegaSTE.

Hi Lonny

| I have a Zip 100 that seems to have developed the dreaded clicking problem.
| Anybody want it for parts? The adapter is fine.
| I'll ship it anywhere in the USA for $3 if someone can use it for parts.
| If not, it goes into the dumpster.

Some ZIP that suffered this problem had a production fault, if yours is in the range you could argue with Iomega and get it replaced on that basis, in warranty or out.

There are several companies that would manufacture it. Flextronics in Mexico
makes the Microsoft Xbox and Handspring visor. That way, Microsoft and
Handspring do not have to go to the expense of building manufacturing
facilities.

5529. Falcon to iMac Networking?

Newsgroup: comp.sys.atari.st
Date: 2001-11-29 23:28:09 UTC
From: Michael and Nicole Freeman <nameerf@flash.net>
Message-ID: <B82C12EE.1AE06%nameerf@flash.net>
Source record: 39945

Hello!

I've been desparately trying to figure out the best way to regularly transfer files between my Falcon and my iMac. I used to e-mail them to myself, which was a bit of a pain, but my ISP has been bought by Prodigy, and since the switch I can't get my Falcon to connect at all using both STiNG and STiK II (and Prodigy staff obviously won't be much help since they aren't even very Mac friendly), so this is out for the moment. I really need to get some files moved back and forth between the two systems, and fairly often. Has anyone successfully networked a Falcon to an iMac?

Here are the options that I've found so far, although I don't know if they'd work. Any comments on this would be appreciated:

1. Ethernet to LocalTalk bridge : Lets Ethernet-equipt Macs "see" and access LocalTalk devices. Could this work using the Falcon's LocalTalk LAN port?

2. Ethernet adapter for the Falcon : I have a feeling this will be quite expensive, and at the moment the only ones I've found require me to use the ROM port. As I use Cubase Audio quite frequently, I don't want to keep having to swap the ROM port adapter and my Cubase dongle. Is there a way to have both connected at the same time?

3. USB to 8-pin DIN serial adapter : These all say they aren't LocalTalk compatible, but can be used on Mac modems and printers. Could this be used for a null-modem type connection?

4. Floppy drive for the iMac : I would prefer a real network, but if there's no other way, I'll have to resort to this method of file transfer.

My iMac currently only has the CD-ROM, Ethernet port, USB ports, and the built-in modem.

Is there any other option I'm not considering? Any advice would be appreciated. Thanks!

Source record: 39947

My Atari machines do the most interesting things, some of them with my help. This time, my STe cannot find its floppy drive. It lost it while I was using it. It is not really missing, because a diagnostic cartridge finds it, and can format a disk in it, write to and read from that disk, and do anything else that could be done to it. But the operating system does not know it is there.

I will get this fixed as soon as my STe can get to an oscilloscope, but that will be a couple of weeks. Everything else works. It is being used to post this.

Has anyone solved this exact problem before?

Jim

I have the same problem, except I have a Hades060 instead of a Falcon. Ethernet would be the fastest, however I don't have a driver for the ethernet card. Hope you get some good replies, I'm very curious how others may have solved this one.

Hello,

Actually the drive is a CDRW drive. Roger at Anodyne says the drive
should work, but Extendos does not like it. HDDriver reads the drive
just fine.

Hi all!

For some time now I've been having trouble logging into the various Yahoo! services with my ID with CAB (v2.7c, Dan Ackerman's OVL v1.4400).

It used to have minor trouble getting in - I would have to try twice before I could get in. Now however, I put in my ID and password and hit submit, and straight away CAB reports Transaction Failed. (It's ok on a PC).

Has everyone been getting the same result? Or is there anyone else with a similar set up still getting in?

Cheers!

James

You might have a config section in Netscape where you can set MIME types for
yourself, add LZH and TOS file types to the ZIP etc that should already be
there.

Don't worry, it works a treat anyway ;-)

Buy a ready-made cable, but make sure that the plugs aren't moulded, you need
to unsolder two wires inside one of them and swop them over.

>Can i use a ST monitor connector to SCART connector for the Mega ST's so I
>can view them on my TV rather than source a hard-to-find monitor?

I successfully connect my 1040 STfm to RGB SCART of a TV set (although
I have an RF modulator built in, because this way you get a better
picture quality), but this is only for low and medium resolution. The
high resolution (monochrome) is no go. I suppose it's the same with a
MEGA.

>Failing that, can I use a monitor like the commodore 1084s or phillips ?
>Would it come with the right connector or is the ST one proprietry?

The ST monitor connector, which is non-standard (13 pin in a
rectangular 4x3 matrix + one below, all in a round DIN-type shield)
is, IMHO, the single greatest screw-up of Atari. Of course, they've
used it so that you can't buy only a connector (for a reasonable
price) and use it to connect other monitors or SCART TVs.

>Can I still get the Atari 520STFM upgraded to 1 meg as it is only 512k and
>some games won't play?

15 years ago soldering "piggyback" additional memory chips was as
usual as tying shoelaces. :-) Today, I suppose, the right chips are
hard to find, but there are other ideas. Look at:

http://www.geocities.com/SiliconValley/Bay/8745/pages/hardware.html

>What are the Mega ST's worth nowadays?

Here, in Croatia, people sell an 520/1040 ST(fm) or a MEGA with a
monitor, a mouse, joysticks, tons of software for under $100.

5548. trouble installing Atari hard drive- please help

Newsgroup: comp.sys.atari.st
Date: 2001-11-30 11:37:43 UTC
From: Joseph Zorzin <redoak@forestmeister.com>
Message-ID: <3C076F86.E70DFA21@forestmeister.com>
Source record: 39961

I just bought from someone online a Mega ST4 and an Atari hard drive, SH205. I'm having trouble with getting the hard drive running.

First of all, I used several Atari computers from when they first came out until when I bought my first IBM compatible PC in

94. Since then I've only used my old Atari to run certain programs I created for my work and haven't yet ported to the PC.

My Atari's floppy stopped working which is why I bought a system

online. For my old Atari I had a hard drive custom built before the Atari hard drives came out.

Anyways, the fellow who sold me the Atari said that he wiped the

hard drive clean but reinstalled the Atari hard drive software so it should boot up, but it doesn't.

I'm not even sure I have the hard drive plugged in properly. It has 2 ports on the back, one is "out" and one is "in". I presume

the "out" is the one to use. I vaguely remember that it is necessary to first turn on the hard drive, let it come up, then turn on the computer. What happens is that the computer's drive "A" light stays on and the hard drive doesn't come up. If I put a floppy in the drive, the light will go off but the computer can't see the floppy complaining that the disc or floppy drive is no good and I do not see an icon for the hard drive. If I turn the computer on without the hard drive turned on, then the computer successfully sees drive A.

The fellow who sold me the computer then emailed me what he says

is the Atari hard drive software. It consists of 2 folders. The first is called Ahdi and in it are 2 files, Ahdi.prg and Shdriv.sys. The other folder is Hdx and in it are Hdx.prg and Hdx.rsc.

So, how do I install this hard drive software? What steps are necessary as far as turning on the computer and hard drive and what should be in the floppy? Do I need to remove those files from the folders?

I used to be really good at Atari tech stuff and did a lot of programming with Laser C. But, it's been almost 10 years since I

did any such tech stuff- and I don't have the hard drive
installation instructions.

I wouldn't be surprised the hard drive has the software already
installed but I must be doing something wrong.

Help will be greatly appreciated.

Hi all !

I'm currently working to updated my small wab pages,
to add the schematics and HEX file available from
internet.

All i want, is it will be possible to anyone to build
easilly the PS/2 interface whithout problems. Sure you
need make the printed board, and program the PIC !

You can have a look at:

http://perso.libertysurf.fr/lfavard/

Atari section and Eiffel interface...My english isn't good, but
if you can understand :-)) This page isn't finished.

Laurent.

I suspect it might be a SCSI drive, in which case you might need to connect
the computer to the 'IN' port, and then connect a SCSI teminator block to
the 'OUT' port.

(This might just be a shot in the dark, since I'm not familiar with the
Atari built hard drives, I'm working from my experience with a System
Solutions external SCSI drive, which I operated with a ST+ SCSI adaptor and
a Falcon. I hope this information is useful though.)

You know, after reading up on this device, I'm rather impressed! If I had the money (and a Falcon030), I might actually consider getting one! The only thing that bothers me is that pesky external ATX power supply! There's just GOTTA be a way of creating an ATX performaing power supply within the confines of the stock Falcon030 power supply dimentions... or does the CT60 literally take up the space of the original power supply? Bad...

It should be plugged in to the "IN" socket and you don't need any
terminators.
But be careful about what files you put in the "auto"-folder, i put a
bad file in that folder by mistake and now I can't boot my HD either.

Yes, I have the same trouble, with many sites that use forms. I
always had trouble accepting a new request to join my Yahoo Webrings,
I could get most of the way through the process but I'd get
Transaction Failed on the very last screen. However, Yahoo has now
let go of Webring and it's under new ownership, and I tried doing it
one day this week and it actually worked. Can't imagine why, I'm sure
the programs on the server end are very much the same.

Hello Ken,

Sorry for the delay, but work sometimes comes first !

On 18 Nov 2001 15:28:49 , Ken Kosut wrote:

>Hi Paul,

>AUTOEXEC.BAT: Are the *.PRG files above actual programs or
> just the name of the program?

The AUTOEXEC.BAT file is simply a text file stored in your AUTO folder, so the PRGs listed are just their names. No paths are required of course as all the listed PRGs are already in the AUTO folder.

>What is FPU__3.PRG used for?

I'm not entirely sure :-)) but I suspect it is a Hades only file, and I need it as the first PRG in my AUTO folder. I doubt other machines need it but I may be wrong. If so, I am sure someone else will tell you.

>> BTW, my AUTO folder order is as follows:

<snip>

>For the above *.PRG and *.PRX programs. I assume these are programs
>in your AUTO folder and that you are referring to the running order
>in xboot. Please correct me if I am wrong.

They are programmes in the AUTO folder in the order there are stored on the drive. You can use XBOOT to alter the order, and if you do, this changes the position of the PRGs on your drive. Once you have found the right order for them, make a note of it in case something happens. It is often the case that certain programmes need to be run before others.

HTH

Cheers

Paul

5564. Atari Times Update 11-30-2001 - Year End Issue Announcement!

Newsgroup: comp.sys.atari.st
Date: 2001-11-30 18:50:28 UTC
From: "Gregory D. George" <greg@ataritimes.com>
Message-ID: <3C07D4BC.8633FC59@ataritimes.com>

Whew! The lack of updates lately doesn't mean I haven't been working hard for the video game faithful! In fact, I'd like to announce the official Atari Times 2001 Year End Issue!

* NEW! The pricing has now been set for the 2001 Year End issue. You can get a copy of this Year-End compilation for $16.95 if you pre-order before December 14! It even includes a color cover!

* NEW! Selling Some Stuff - I'm doing some clearing out, so maybe you'll find a game on my list that you've always wanted?

* NEW! Is Emulation Better? - Just a few Pros and Cons on running emulators on your PC.

Once the Year End issue is out the door, expect more weekly updates on The Atari Times!

5565. Re: Falcon to iMac Networking?

Newsgroup: comp.sys.atari.st
Date: 2001-11-30 19:07:00 UTC
From: Ekkehard_Flessa@wun.maus.de
Message-ID: <200111302007.a26218@wun.maus.de>
Source record: 39796

Hi Mike!

MANF>Is there any other option I'm not considering? Any advice would be
MANF>appreciated. Thanks!

Connect a CD-burning device to the Mac and store the files there (on CD-RW for multiple use). If the iMac has got an SCSI port, you could use an external device and use it on both the Mac and the Falcon.

mit freundlichem Gruï¿½ aus Ahornberg

> designed these machines, do you?

I assume Medusa designed the Hades, since they sold it. Of course, they had an outside company fab and assemble them for Medusa... unless Medusa has their own fab/assembly facilities. But as for being "in the know" about much of anything to do with Atari/TOS clones these days... I am, as they say... clueless.

I ain't been "in the scene" since I sold my Falcon030 several months after buying it new, years and years ago (when I saw that support for my Falcon030 was dwindling fast and that Atari had abandoned the computer market and made a last ditch effort to survive with the Jaguar, I cashed my chips in quick! I could just smell disaster coming.

Odd that I acted in like fashion (I sold my copy of BeOS R5 Pro) when Be, Inc.'s stock went through the floor. Took awhile (over 1.5 years), but they died just the same. Bad management decisions from within will do that to a company, yaknow.

I'm also assuming that if they (Medusa) stopped producing/selling the Hades, it was not making money for them, or they decided to go a different route (something even better than the 060... PowerPC, we can only hope) or they went out of business or something.

So, since you ARE "in the know" about these things, please inform me so that I may prosper with this knowledge and not look quite so silly assuming things that are not as they appear.

The "in and "out" ports may mean plug your ST "in"to the hard drive and
daisychain another drive "out" from it. In other words, plug the cable into
the other port and see if that works.

I was, but I still tinker around outside this newsgroup, peeking in now and then to see if anything will give me hope of a more interesting future for TOS-compatible computers... and a reason to actually consider investing in one.

The CT60, except for the pesky ATX power supply requirements, is VERY interesting. Makes me kinda wish I owned a Falcon030 right about now, but haven't got (and can't much warrant much a reason to use) the $500-$600 (or more) for one.

Hey, at least I'm not blathering on about my plans and dreams anymore. That was probably the biggest reason to be rid of me... so don't worry, I'm not here to bother anyone.

You really have a way of showing your stupidity, you don't fully read posts and you make tons of assumptions about individuals and businesses you know nothing about. It would be wise for you to drop the clone topic as well.

Fredi is highly respected, especially by us users who went that extra mile to obtain one of his clones.

I'm done with iomega, I simply don't care much for it anymore. Actually it
still works, it just clicks at strange times, most un-nerving. I backed up
all my data and it's going bye-bye. Thanks for the tip though.

Hi,

I am having some problems connecting with PPP-Connect.

Falcon/Magic 6.01/HS-modem

I have DRVIN.PRG and SCC.PRG in the AUTO folder.
(also SOCKETS.PRG)

Is DRVIN necessary with Magic?
Do I have to adjust DRVIN and SCC with Setter?

I used ICONF.PRG to create a New set.

I got it to dial in one time, but it would not connect.

Local Code Reject NO
Remote Code Reject NO
Local Protocol Reject NO
Remote Protocol Reject NO
Remote Authebntication Request NO
Remote Line Quality Report Request NO
Peer did not provide Local IP-address NO
DNS IP address NO
Timeout YES

I was told to leave the local IP address set to 0

I put in a DNS IP, but now the modem won't dial in.

I would appreciate any suggesstions.

thanks

ken

Glad to hear that's at least possible on *some* TOS computers! Anything like
that for the Falcon? How much is a thing like that? etc...

Also, anyone know about using the Ethernet to LocalTalk bridge? This sounds
like the most interesting option to me, if it works. Maybe I'll actually
shell out money and try it. I guess if it doesn't work I can return it. I'll
see what others say first. Thanks!

Thanks! I thought of this, too. It's kinda the same as my floppy drive
suggestion, only it'd hold a bit more. Great if I need to transfer large
amounts of stuff, but not too practical if I just need to transfer a small
2kb file. Too bad I didn't wait another year before buying my iMac. Now they
come with CD-RW's as standard. :(Oh well.

I now have the computer connected to the Atari hard drive via the "in" port. But, apparently the boot up software isn't installed. I'm not sure how to use the software mentioned above. I see that Hdx.prg is a format program. I ran it but haven't yet done a reformat as I'm hesitant to ever reformat unless I know I should. Since I can't get the drive to work, I suppose I should go ahead and do this. The other program, Ahdi.prg, I presume will install the boot up software on the hard drive? When I ran Hdx, without formatting, I did notice the hard drive lights flickering, so apparently the computer can see the drive at least for the purpose of formatting.

Any last suggestions before I go ahead and reformat? I always dislike running programs without detailed instructions.

Yes. Driver, scc and sockets in that order.

>Do I have to adjust DRVIN and SCC with Setter?

I think it should work as-is. English docs for HSModem are on my web site
BTW.

>I used ICONF.PRG to create a New set.

Make sure you set the port to Modem2, usual 8-N-1 for the other settings,
I've got a simple atz for the modem command.

Local IP address should be 0.0.0.0

Login - try just the "Done" entry, with PPP ticked

DNS - either enter the one that the ISP provides, or enter 0.0.0.0. It will
then be negotiated during connection. Failure to enter or negotiate a DNS
won't make a ha'porth's worth of difference to dialling in, just that you
won't be able to browse any web sites unless you know their IP address.

>I would appreciate any suggesstions.

You might find it's a problem with the running order in your Auto folder, see
above. If IConnect stalls during the "negotiation" stage, then it's worth
activating the terminal and responding to your ISP's questions - you can use
the results as a script. Usually the "Done" entry is all you need, but the
ISP I use now wants a little chat with a script.

HTH.

Before you do, double-click ahdi.prg and then try installing and icon on
the desktop for C: It may not need formatting, just having the driver
installed again.

Hi. Joe,

It's been a long, long time since I used the Atari software, so I hope don't make a mistake here. <G>

> I'm not even sure I have the hard drive plugged in properly. It
> has 2 ports on the back, one is "out" and one is "in".

Someone in the thread said to connect the computer's port to the "in" port of the hard drive. That is correct. (I double checked that by looking at my Mega/Pizza box hard drive combo.)

> The fellow who sold me the computer then emailed me what he says
> is the Atari hard drive software. It consists of 2 folders. The
> first is called Ahdi and in it are 2 files, Ahdi.prg and
> Shdriv.sys. The other folder is Hdx and in it are Hdx.prg and
> Hdx.rsc.
>
> So, how do I install this hard drive software? What steps are
> necessary as far as turning on the computer and hard drive and
> what should be in the floppy? Do I need to remove those files
> from the folders?

It sounds like you have all the software.

1. If you don't have a blank formatted 720k floppy, make your self one now.

2. Copy the 2 folders to the blank floppy.

3. Make a new folder on the floppy, and name it Auto.

4. Copy SHDRIVER.SYS from the AHDI folder to the root directory. Leave the original file where it is.

5. Copy AHDI.PRG to the AUTO folder.

6. Repeat the first 5 steps. Label one disk as to the contents, call it Master, and write protect it. Do the same with the 2nd disk, but call it Working. Don't write protect it, and this will be your boot floppy if you want to boot from floppy rather than the hard drive.

7. Turn on the hard drive.

8. Insert the Working floppy in the Mega. After the hard disk is up to speed, turn on the Mega.

If I haven't given you bad information, your hard drive should show up on the desktop after booting. If the answer is yes, save the desktop.

The desktop file will be saved to the floppy disk (I think <G>)

If you want to boot from the floppy disk, you're done. If you want to boot from the hard drive, continue on.

The following assumes the hard drive is already formatted.

9. Open the HDX folder on the floppy, and run HDX.PRG. Somewhere in the menu structure you will find "Install". Follow the instructions, and an SHDRIVER.SYS file will be written to the hard drive. If you get a message box telling you that things aren't working, my guess would be the drive's formatting has been damaged. If it was my hard drive, I would Format the drive, picking the options I preferred. Then you should be able to install SHDRIVER.SYS.

10. Reboot the computer. You can use the reset button if you like, a cold boot shouldn't be necessary.

11. If all has gone well, you should now have a desktop with the hard drive icon on the desktop for C: drive. If you partitioned the drive, I don't remember if the other partitions automatically show up or not.

12. Save the desktop, it will be saved on C: I think.

Unless I've screwed up, you should be up and running.

The used mac I got also lacks a cd burner. I now have a scsi PCMCIA card reader/writer on my TT030 and my Hades, got one for $26 and the other one for $45 off ebay, and I use these to move data back and forth with an 8mb smartmedia card. I can PC format the smartmedia card, so I'm wondering if I get a USB PCMCIA card reader/writer if the mac can deal with the PC formatted cards? I may try this route, it's cheap and I'm half way there. If it works I can use this until an ethernet solution presents itself, I also have some larger smartmedia cards so I can move very large volumes of data rather quickly.

Forgive me, but I just saw this thread (first time in this group for a long time) and I'd like to catch up a bit.

I assume this is about getting back the Atari name and re-releasing a computer under it? If it is, it's quite ironic because I was thinking the same thing over the past few weeks.

Another question would be: Is this supposed to be compatible with the current (well, you know) ST/STE/TT/Falcon line, or something totally new? I would opt for totally new, myself, with BeOS as the operating system of choice. I have no idea what anyone else's thought on that is.

And finally... I had read an older interview with Nolan Bushnell where he seemed to be a tad upset over the fact that videogames are now dominated by the Japanese ("it started here, it should still be here") , and I almost get the feeling that he misses Atari since he has plans on coming back with his own Atari II (probably not with that name, obviously). Has anyone contacted him about wanting in on this type of action? I don't think he's too keen on Microsoft either.

If anyone could fill me in a bit on this I'd really appreciate it. I really do want to see a come back of Atari in some form.

Thanks.

Mac OS should have no problem reading the PC-formatted cards so long as
the File Exchange control panel is turned on, otherwise it'll attempt to
read the card as a Mac volume (HFS).

FamilyNet Newsgate

The Atari laser printers are fairly robust and you can still get parts from Best Electronics in California. As for that price, it comes out to about 45.38 come out to about 85 US dollars I believe... all and all it seems like a good price.

The commodore or its philips equivalent(which i had long ago) only support Low and Midres graphics,rendering most sw (except for games) useless.The best solution is a first generation multiscan monitor(horizontal frequency 15-38khz) with an Atari monitor switchbox.The colorful atari logo gave the "rainbow TOS " its name.Upgrading the RAM would require difficult soldering and hard-to-find RAMs.

I have no experience with card readers. It's just that I recently bought an iMac to replace my 6500, and have been looking at different USB alternatives. I was searching the 'net for a USB floppy drive -- for my digital camera -- when I came across various pieces of card reader info. A company called SmartDisk (www.smartdisk.com) has a three-slot unit called VST Tri-Media Reader that handles floppy disks, SmartMedia, and CompactFlash. Since I didn't need the unit's other features, I bought a barebones Macally USB floppy drive -- a TEAC mechanism wrapped in Tupperware. But the Tri-Media Reader looked interesting, perhaps a good way for you to kill two birds with one stone.

We don't know if this is an SLM605 printer, where supplies are easy to get
hold of, or the trickier SLM804.

Difficult to give advice then.

I tried all of the above with no luck, the drive must be defective.

While booting up, with the floppy in the drive (as described in your instructions)- I see Ahdi working to identify the hard drive, but it can't- it says something like "not bootable". When I attempted to do a format it lists the potential 0-6 SCSI devices but next to each I see "not responding". If I try clicking on SCSI "0" and try to proceed it just gives up after awhile.

The cable must be OK as during all the above efforts I do see the hard drive lights flickering so the MEGA is connected to the drive.

In the HDX program, there is no option for INSTALL, which apparently sets the boot sector. I keep hearing about this function but don't know where to

find it.

Just a quick mention for the iOmega service/returns ppl here, I had the
same problem so contacted them just to see if it could be fixed and 'after
listening to the clicking sound' sent me a replacement drive and zip disk
in 2 days *plus* sorted out the return carriage of the faulty drive.

From experience.

The best solution is separate hi res and low/medium res monitors, with a
switch box.

If one blows you ain't completely stuffed.

That is a possibility. But it's rattling around in my mind that Atari made some little modification to the SH 204 & 205 so the weren't 100% SCSI compatible. This is info I would have heard about long before I ever owned a hard drive. My first hard drive came with my Mega 4, and the 205 may have been discontinued by the time I owned a hard drive.

> While booting up, with the floppy in the drive (as described in your

It would seem the external cable is ok. I assume it is connected to the controller board inside the 205 case just like all other hard drives I've seen. If so, there will be a cable from this board to the actual hard drive itself inside. It could be this cable is loose or defective.

> In the HDX program, there is no option for INSTALL, which apparently sets

Is there an HINSTALL program? That name just now popped into my mind. I might try to find my original disk that came with my Mega ST for the hard drive. I should still have it, but I may have lost it as that system has moved a number of times from state to state.

What sometimes happens, apparently, is the disk itself or some irreplaceable data gets damaged by the drive somehow. I used to have a friend who bought a ZIP for his Windows machine when it first came out.

When he started having these problems with newer ZIP units, he went round and round with Iomega, and they were claiming it wasn't the units. Which of course it was and that's why they now fix/replace for free if the unit is bad.

If the disk itself is bad, you can sometimes you can save it by formatting from scratch with HDDriver and then partitioning it to TOS and DOS compatible. I don't know how Uwe does this, but the process does sometimes work. <G> Been there, done that.

I have owned an STe & STf in the not too distant past. I currently own an PCC PowerBase (Mac OS 8.6) and iMac DV SE 400 (Mac OS 9.2 & X (10.1)). I also have 3 digital cameras that use Compact Flash to store images. I also have 2 HP LX 200 Palmtop Computers that have PCMCIA slots. With adapters, I use Compact Flash with these also. I have a Micretech (www.microtechint.com) USB Compact Flash and SmartMedia reader/writer. With this card reader/writer I am able to share files between all of these devices by swapping the Compact Flash card. I am totally amazed at the speed and ease of use of using CF to move information between devices that were never designed to communicate with each other! As a side note, the price of CF is coming down.

The nearest thing I had was several times, the disk directory was empty, but known to have files. Turning off the machine and dropping from 2 inches onto a hard flat surface cleared it up. Eventually, slight lifting then pushing down on all socketed chips becomes a must.

I was right, there is an HINSTALL program. I've been sorting through
old Atari stuff to sell here or on Ebay, and I found copies of Atari's
hard drive software, versions 2 and 3.

Run your HDX program, and find out the version number that you have. If
it's 2 or 3, I'll zip the software I have here and email it to you.

Hi wierdo

| You know, after reading up on this device, I'm rather impressed! If I had
| the money (and a Falcon030), I might actually consider getting one! The
| only thing that bothers me is that pesky external ATX power supply!
There's
| just GOTTA be a way of creating an ATX performaing power supply within the
| confines of the stock Falcon030 power supply dimentions... or does the
CT60
| literally take up the space of the original power supply? Bad...

Well since you have to buy it a case anyway, get an ATX case and you'll get
a free PSU, moron!!.

>the 'OUT' port.

I think the old Atari hard disks had DMA connections with an
internal host adapter. Most were of the old RLL or MSF type -
definitely not SCSI.

But, Joseph, you should connect his DMA lead to the IN socket! The
OUT was mainly for the Atari Laser, but could be used with a Link
or similar device to connect to SCSI drives. Also, try downloading
ther demo version of HDDRIVER from Uwe's site. If it works, buy
the full version -it's the best Atari harddisk driver there is!

You can run HDDRIVER from the floppy - as you can AHDI - and install
it on the hard drive. Don't forget you have to add the partition icons
manually to the desktop, unless you have Thing or jinnee which will
install them all with one mouse click. With the Atari desktop, click
on one of the floppy icons, then 'Install Disk Drive' and type in 'C'
(capital!) for the drive and 'Hard Disk' for the name. If the disk has
several partitions, repeat this for each one, incrementing the letter
by one each time (it doesn't matter if you install too many - if the
partitions don't exist you will get a warning message when you try and
open them, so delete the surplus ones by dragging their icon(s) to the

wastebasket. Once you have icons for all partitions installed and
dragged to your preferred positions, don't forget to 'Save Desktop'.

Regards, /Peter/

5621. Please remind me

Should be tried...
The CT60 occupies only half space of the falcon power supply.
A small power supply is possible...but you know that amiga have external
supplies and it's not so boring...

Should accept either as long. I have a Sanyo laptop drive that could be
made to work on the Stacy as it has a cut down shugart interface.
Basically it doesn't have as many GND pins. Problem would be making it
fit neatly, these aren't standard. Or did the Stacy have a standard
height drive, surely not!

I tried it with the shareware version as I currently have no CD drive on
my Falcon to whip my full quake pak files across. It did run pretty slow,
even with my Phantom accelerator. I was also using the 68000 version as I
have no FPU. I wouldn't mind trying to get a 68882 rated for 50Mhz and
oc'ing it to about 80 or even more. Quake only runs on PCs with DX CPU
which shows that it needs a FPU to run at any decent speed. Worked
though, just unplayable. However, I would like to know if it works on
Hades or CT60.

I have that badge from the ST keyoboard mounted on my STE tower and on my
Falcon I laminated a FUJI logo to fit the space for makers. I also kept
the Falcon badge on the keyboard. It's pretty obvious now that it ain't a
piece of crap ;)

It looks like the sign-in process goes through a unsecure, then secure,
then unsecure connection. This could be messing up CAB.

Hi !

AVR Rulez ! is a new software whose purpose is to program
ATMEL AVR microcontrolers with In-System Programming abilities.

It runs on ST-STE-TT-Falcon.

Next to come ...

- Milan/Hades compatibility

- Microchip PIC programming (ICSP)

- AVR/PIC assembler

http://ginesj.free.fr/avrrulez

Hello,

Thank You Derryck and Newsgroup for suggestions with CAB and I-Connect.

I rearranged programs in Auto Folder (DRVIN, SCC and SOCKETS)
Went to Terminal Mode and Logged on Manually.
After my ISP made an adjustment, I was able to log on.

I also feel the need to ask, what are the xTOS people "bringing to the table" to convince people to buy one of their systems? This is a necessity anywhere, especially when a system is as relatively "unpopular" (in terms of mass appeal) as the Atari/TOS market has been.

The MEESSE card is one good thing, for audio enthusiasts. But what about general users, like me. I'm a game player, Internet junkie, etc.

And then, one must also consider the roadmap for the Coldfire chip(s). How do they fair over the long haul (3 or four years down the road). Is there a future chip that will carry the lineage another few years down the road or eventually migrate the code to PowerPC or another chip that has a much longer roadmap?

And, even with all the processing power the Coldfire chip offers, does that also mean we will have/get:

1) drivers for any video card(s) we want?
2) a fully capable version of CAB (or another browser), to browse the Internet to our hearts content without concerns of going someplace we can't enjoy because there is something that our browser doesn't support?
3) More commercial software?

If all we get is more power to use the current batch of software we own that much faster, why not just use an emulator? But.. if we somehow also can stimulate new software/hardware growth, THAT'S what really makes this xTOS system worthwhile!

A faster computer isn't what we really need so much as revived growth, but the main question is... HOW do we get that to happen?

Even if it works it is irrelevent whether the disk is TOS/DOS compatible
or simply TOS compatible. This will absolutely make no difference. You
cannot fix problems with broken hardware by selecting another
partitioning scheme by software.

Are you using Newsie? Usually, it has to be MIME (which is *not*
selected by default when you attach a file I think), my recipients
can't open attachments if they're sent using UUE.

It is not logical, but I've had it work. On a couple of ZIP cartridges, I got the dreaded clicking and could not read the cartridges on any of my computers. I could not format them with Iomega's software on my Windows machine. But I could format them with HDDRiver, make them TOS/DOS compatible, and they would work on all machines. I can only remember having to throw away one cartridge that would not format anywhere.

If there is no mono icon at all, just create the new resolution in the
most right menu.

If the mono icon exist (empty or not), just do like in your description
but instead of "paste" open the image (file menu) previously saved by
the "copy" operation (in the clipboard folder) then select a bloc in the
image with the mouse. You will be asked to copy this selection in the
editor.

I think actually you do want a faster computer, and one with more
memory etc. It should have an easy-to-use, stable, multitasking
interface etc etc. Then if you can persuade programmers to produce
quality programs (and I certainly do not imply that the Atari
programmes have been of low quality) at a good price, you might have a
chance of reviving "Atari".

It's replies like yours that inspire me and NOT replies from the likes of Steve Sweet, who see nothing but the way things are with no hope of change.

Thank you. Now, who wants to "try the impossible" and actually design/build an ATX-class power supply that WILL fit inside the remainder of space inside the Falcon case with the CT60 installed? There's gotta be a market for it... I know *I'd* buy one in a heartbeat.

Oh, but... shucks, I ain't got a Falcon030 yet! Hmm. :-)

5659. Help reading/printing SoundPool's AUDIO TRACKER Postscript manual

Newsgroup: comp.sys.atari.st
Date: 2001-12-03 19:35:36 UTC
From: nurmix@spam-free.com
Message-ID: <3c0bd1bf.1690307@news-server.socal.rr.com>
Source record: 39877

Well, I finally decided to order Soundpool's AUDIO TRACKER directly from SoundPool. I live in California (USA), so to make it cheaper and easier, they decided to e-mail the software to me, along with the manual in 2 Postscript (.PRN) files.

The trouble is, I have very little experience dealing with .PRN files. I've downloaded a couple of small/free Windows utilities that are supposed to print, and/or convert these .PRN files to .PDF. Unfortunately, neither seems to work. Any attempt at printing results in numerous pages of garbage characters. And as far as doing something with them on my Falcon, I don't even know if I can. I have PageStream, and know that you can export to a Postscript file, but I see no way to import or print one.

Also, while they have been pretty responsive to my e-mails when I was ordering the software, SoundPool have chosen to more or less ignore my questions about the manual files, and apparently don't have the manual available in any other format.

So, I've put the ZIP archive of the two .PRN files on my web site, in hopes that someone here can either convert them to .PDF, or perhaps print them, scan them, and e-mail them to me. Or, if someone wanted to actually [postal] MAIL them to me, I'd be more than willing to pay for shipping.

Thanks in advance, I hope someone here can help! For the direct download of the ZIP archive, click the link:

Why don't you sell me one of the Stacys and I'll take care of it :P

Any older SCSI drive should be ok on it. Keep in mind that TOS 1.04 can't support partitions that are too big. I forget the limit. I am under the impression that any ST 720K drive will work on the Stacy.

Joshua.

It is!
It was the new CAB.OVL v1.8601 from Howard Chu for MiNTNET that wouldn't connect to this URL, at least not on my system.
Then I tried with Lynx for MiNT to connect and it showed up correctly.
Also with CAB + GlueSTiK + Dan Ackerman's the URL came up fine.

Save the colour icon as an image and then re-load it as a monochrome icon
(import image). That's the only way.

Greetings,
Matthias

5664. Re: [GAME] New Quake version available

Newsgroup: comp.sys.atari.st

From: Patrice Mandin <pmandin@fr.mailandnews.com>
Message-ID: <slrgu9.aei.ln@127.0.0.1>
Source record: 39892

Dans l'article <jfp5u9.246.ln@127.0.0.1>, "Patrice Mandin"
<pmandin@fr.mailandnews.com> a tapotï¿½ avec ses petits doigts:

For people having problem to run nuq:

You need the shareware pak file:
id1/pak0.pak Version shareware (size 18 276 119)
The complete version needs this supplementary file:
id1/pak1.pak Version enregistree (size 34 257 856)

id1 is a subdirectory from the directory where you put the binary:
./nuq.ttp
./id1/pak0.pak
./id1/pak1.pak

This is why I recommand to get the PC (dos) version, where you just have
to put nuq in the same file as the PC binary.

Some people asked me why it could not run: I did not replied because I
want to debug the FPU version first. (With Aranym, I get 4 bombs when SDL
initialize itself, maybe a non emulated FPU instruction).

From: Francisco L Fernandez <fran@tkp390.flunet>
Message-ID: <3c0be0df_1@news.landsraad.net>
Source record: 39880

Hello,

It is strange to see AHDI looking for SCSI drives. SH205 wasn't an SCSI drive, but an MFM or RLL one, altough with the suitable AHDI translator circuitry. Perhaps you are using a too "recent" version of AHDI. I remember that in version 3.x or 4.x that you could select explicitly the SH205 drive, and each model of the Megafiles when you were inside of HDX.

Also you could have a problem with the DMA chip of the MEGA. I have one in my countryside house that has ever had problems. First with a Megafile unit an later with an SCSI unit with GESOFT host adapter. Lately it can't even boot the drive, and sometimes it corrupted data.

> I tried all of the above with no luck, the drive must be defective.
>
> While booting up, with the floppy in the drive (as described in your

> an ATX-class power supply that WILL fit inside the remainder of space inside
> the Falcon case with the CT60 installed?

No offense intended, but did you not read the post you are replying to? He said the Micro ATX PS might do it. So if it does work, why would you want someone to design/build one. Kinda like re-inventing the wheel, no?

> There's gotta be a market for
> it... I know *I'd* buy one in a heartbeat.
>
> Oh, but... shucks, I ain't got a Falcon030 yet! Hmm. :-)

Go ahead and get one! There's plenty of used ones out there! Plus, it might give you a little better perspective on the Atari market if you actually own one. I'm on my second one. This one I've re-cased in an ATX mid-tower with a PC power supply, placed the "ATARI Falcon030" plaque from the original machine on the front under the floppy drive (looks like it was made to go there), put in a CD-RW drive, and use a MSTE/TT keyboard (my personal favorite Atari keyboard made). It's also got a Nemesis board installed and a multisync monitor. I've just got a few more little things to do before the project is completed, but it's in working condition and looks sweet! Other than for Internet stuff, I use it more than my new iMac, as I think it's simply more fun. You should try one! Then you could get a CT60 when they're released, since you seem to be impressed by that. It would make for a very nice machine, indeed!

5669. Misc ST Items FS

Newsgroup: comp.sys.atari.st
Date: 2001-12-04 03:06:12 UTC
From: fmhcom@operamail.com
Message-ID: <E4XO7.1626$h21.53707@newsfeed.slurp.net>
Source record: 39887

Hi,

Here's some Atari ST stuff that I'm not using
anymore. Those are my asking prices. I'm open to offers.
Buyer pays shipping. I am also open to trade offers.
E-mail me your list to fmhcom@operamail.com or for
more info.

My want list is near the bottom of this list.

HARDWARE

---
60 Meg SCSI external drive in a nice 9.5" x 9.5" x 2.75" case.
Has 2 SCSI 1 connectors allowing passthrough.
Comes with SCSI 1 cable. $60.00

Syquest 44 drive with 1 44 Meg Cartridge and ICD Link.
Drive comes in nice shoebox style case with integraded ICD Link
allowing simple plug and play to ST, STe, and TT. Comes with one
HDX formatted 44 Meg cartridge. There is room for a second
hard drive or even a CD-ROM drive. Has a male SCSI 1 connector
cable already wired. $100.00

Atari PC-1 Computer System. This is Atari's first attempt
at the IBM clone market. The IBM clone is in an Atari Mega ST
case with a 5 1/4" 360K floppy drive instead of the standard 3 1/2"
ST drive. It has an 4.77/8.0 mhz CPU with 512K RAM. Has dip
switched Video Adapter for MDA/CGA/EGA graphics. CPU comes with
an Atari IBM keyboard, Atari labeled MS/DOS, Atari labeled
GEM Operating system, and manuals that are photocopied. Serial
Number is #0007 so besides being very rare it's one of the First!
Also included is an Atari PCM124 mono MDA/CGA/EGA monitor in the
box with paperwork. For both computer and monitor $250.00

Fast Fax by Michtron. This is the original fax hardware/software
for the Atari computers. Works with ST 520 to Falcon. This is a
special Michtron 9600 Send/Receive Fax Modem with software. The
software is very efficient, powerfull, and simple. Send, receive,
view, log, and print, faxes. has drivers for popular printers and the
SLM804/SLM605. Use a spare 520 or 1040 floppy only as a stand alone
fax machine. Comes with special fax modem, diskettes, and manual. $30.00

Atari Portfolio 64K Memory Card. This unit is new but I can't
guarantee that the battery is still good due to it's age. $10.00

AtariSoft IBM Games
** Note ** these games are made for the IBM PC on 5 1/4" floppy
These were made in 1983 when Atari was making games for multiple
computer and video game consoles. All the games bellow are
BRAND NEW and never used! Games are $15.00 each shipped.

Battlezone *sealed*
Centipede *sealed*
Defender *sealed*
Dig Dug *sealed*
Galaxian *sealed*
Gremlins *sealed*
Jungle Hunt *sealed*
Moon Patrol *sealed*
Pacman *sealed*
Robotron 2084 opened
Stargate *sealed*

GAMES

Imperium Game manual and registration card from Electronic Arts.
I no longer have the disks or box but for someone who needs
the docs here you go. $1.00

S.D.I. by Mindscape. Complete with box, docs, and disks. $5.00

Plan 9 From Outer Space by Gremlin. Complete with box,
docs, and disks. $10.00

Road Runner by Mindscape. The ST version of the arcade game.
Obviously with the Road Runner and Wile E. Coyote.
Comes complete with box, docs, and disk. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Test Drive by Accolade. The classic driving game for the
ST. Comes with box and disks. $5.00

Star Raiders by Atari. The classic Galactic Adventure game.
Comes complete with disk and docs. $5.00

Elvira Mistress of the Dark by Accolade. Explore the 800 room
castle in this huge adventure game. Comes on 5 floppies.
Comes with box, docs, and disks $10.00

Pipe Dream by lucasfilm Games. The classic Pipe Dream game in
one and two player modes. Comes with box, docs, and disks $10.00

Gem'X by Kaiko. Kind of a Tetris type where you have to match
the computer's pattern on the right side. Box states there are
400 levels. Comes with box, docs, and disk $5.00

Spelling Bee by Atari. The scholastic series spelling program
for kids. Comes with box, docs, and disks. $5.00

Battlezone by Atari. The classic arcade game for the ST.
Comes with docs, disk and box (box has been flattened) $5.00

Stir Crazy Featuring BOB by Infogrames. Box says 6 games in 1.
Comes with disks, docs, and box. $5.00

Mickey Mouse the Computer Game by Gremlin. Help Mickey find
Merlin's Magic Wand in the 4 towers of the enchanted Disney
Castle. Comes with disks, docs, and box. $5.00

Quartet Gold by Red Rat Software. Has 4 games in this pack.
Cosmos (Galaxian clone), Pengy (Pengo clone), Screaming Wings
(Xevious clone) and The Secret of Steel RPG. Comes with
disks, docs, and box. $5.00

Magical Math by Atari. A Bently Bear at home tutor Sholastic
Series title. For grades K-6. Comes with disk, docs, and box. $5.00

Bridge 4.0 by Artworx. Play the card game Bridge on your ST.
Comes with disk, docs, and box $5.00

Renegade by Mastertronic. A space shooter type of game kinda
like Star Raiders? Comes with disk and docs. $5.00

Captian Blood by InfoGrames. A Space Adventure game. Docs state
"This software explores a new concept, the BIO-GAME. The characters
can evolve, be born, die, trade information and generally get on
with their own independent lives." Comes with disk, box, and docs. $10.00

NightBreed by Ocean. This is from Clive Barker's Nightbreed story.
"Make your way through the caverns of Necropolis to the underground
city of Midian and where Nightbreed creatures dwell." "This all
action adventure allows you to shoot, punch, and jump as you
explore the terrifying underground environment of Nightbreed."
comes with disks, docs, and box. $10.00

MISC SOFTWARE

Emailer V2.3 by Application Systems Heidelberg (ASH). This is
the premier E-Mail package for the Atari platform. This is a
German version that can be upgraded to V2.3f which is the latest
for free via ASHï¿½s Web Site and can be in English via the free
RSC files also from ASHï¿½s Web Site.

For more info please goto
http://www.application-systems.de/emailer/index.html
This is new and come complete with 720K floppy, docs, registration
card, and packing envelope. $30.00

ST Control by Trio Engineering. A BASIC like language that
is closer to using normal language to program. Example
"Draw picture with Neochrome" Includes box and diskette
no manual. $3.00

MultiTOS by Atari. Premptive multitasking for any ST, TT, or Falcon.
Comes complete with binder, manual, and on 720K floppies $15.00

Dac Easy Accounting by Dac Software. A complete accounting system
for your Atari computer. Comes with disks and manual. $5.00

Degas by Batteries Included. The classic garphics and drawing
program for the Atari ST platform. Comes with book and disk $5.00

HiSoft BASIC Professional by Michtron. This version has a fully
integrated BASIC compiler and editor to create compact and quick
Atari programs. Comes with large manual, box, and disk $15.00

Marcel Word Processor 2.2 by Marcel Software. A full featured
word processor for the ST to Falcon. Comes with 2.0 and 2.2
manuals and disk. $5.00

Flash by Antic Software. GEM based Telecomunications software.
Does VT-100 with a built in word processor and more. Comes
with disk manual, and box. $5.00

Squish II by Trace Technologies. Save storage space quick and easy
compress your programs and accessories. Comes with disk and docs. $5.00

Easy Draw by Migraph. A full featured professional drawing
program. Comes with disks, docs, and box $5.00

BOOKS $10.00 each unless noted

6502 Applications. Published by Sybex.
A comprehensive 6502 Assembler book.

6502 Assembly Language Programming. Published by Osborne/McGraw-Hill.
A comprehensive 6502 Assembler book.

The Best Atari Software. By the Editors of Consumer Guide
This book covers all software for the Atari 8-bit from
productivity to games. Hardware requirements are listed and
each piece of software is rated on a scale of 1 to 10.

Machine Language for Beginners. By Compute Books.
A begginners guide for Atari, VIC, Apple, C64, and PET computers.

MAGAZINES

I am working on a huge list of Atari and Classic Video Game/Computer
list. Please E-mail on what I have at the moment.

CD-ROMS

Byte on CD-ROM. What you get is all issues from Jan 1990 through
June 1997 on a single CD-ROM. It includes full text and graphics.
The CD has reviews and announcements of the Atari TT, Falcon, and
Portfolio besides everything else that happened in the computer world
for 7 years. Minimum requirement is Windows 3.1 and up to run. $20.00

WANTED

MagiC Mac Ver 6.XX
AIXIT TT RAM board or any TT RAM board with at least 16 Meg
NDVI 5.XX full version or upgrade
Atari Jaguar Battlesphere
Falcon MKX Case

OTHER Platforms

I also have lists of software for other platforms like IBM, XXX CD-ROMS,
OS/2, Mac, and Amiga. If interested please request a list.

I don't know. I do know I've seen many pictures of stuff that never made it
to market. When the first 'buyer' comes here and gives a glowing review
of a finished product that will make a difference. I don't personally
plan to buy a ct60, already have an 060, but I'd like to see it get released
so the 060 user base increases.

The problem with Tempest is that it is not yet completed. But from the
information that can be found it seems it is very close to completition.
Some simulations left to do, then wiring the prototype (the actual CT060
stadium) an voila :)

How childish...

Btw. Cortex has nothing to do with the development of the Tempest,
they're just a distributor of Sven Karlsson's products.

Yep. Iomega's software just said it couldn't be formatted. No reason
why either.

It doesn't always work this way, but most of the time it has for me.

i have an entire lof of atari stuff for sale...buy it by the piece, or make me an offer on the whole lot.

Atari STfm computer, upgraded to TOS 1.4, 4 meg memory, upgraded done by Wizztronics in NY, this is a 100% solid machine, great for running music software like cubase, comes with NICE aftermarket mouse $100 firm

Atari STf computer, upgraded to 4 meg memory, a little shaky but works, tech spcial $50

Original Atari Mouse, $20

Steinberg Cubase 2.0 with dongle, a REAL version of Cubase, not a crack, comes with "Complete Guide to Cubase" book ($35 value), this is rare....$75 firm

2 Atari SM124 monochrome monitors, good working condition, one in original box! $50 each

Set of covers for ST and Monitor, $10

all prices do not include shipping. email me for more information

I think there is a good chance this could happen. Afterall, there was
going to be a Milan dealer in the US until the Milan II went under.
Even if this does not happen, that is not going to stop me and it
should not stop you or anyone else. I would gladly order it from
over-seas.

That is what I am waiting for, but I think they are depending on people
who actually know of TOS machines. My quess the computer will sell in
record number over in Germany. I am hoping they will include built-in
MIDI because this will attract a large number of people.

>The MEESSE card is one good thing, for audio enthusiasts. But what about
>general users, like me. I'm a game player, Internet junkie, etc.

I am a gamer also (hence my handle:Gamer), but playing games on the
computer is not one of biggest concerns. We have things like the
Jaguar, Gamecube and the Xbox for that. However, I would not mind so
RPG computer games.

>And then, one must also consider the roadmap for the Coldfire chip(s). How

>enjoy because there is something that our browser doesn't support?
>3) More commercial software?

I am sure Medusa will be doing the video card drivers for the XTOS
machine like they did for the Hades. I am on the development team for
Highwire, which is another browser for TOS machines. It is going to be
better than Cab (faster, ect) and will be Javascript compatible.
Hopefully new software will surface when the computer does. That we
will have to wait and see.

>If all we get is more power to use the current batch of software we own that
>much faster, why not just use an emulator? But.. if we somehow also can
>stimulate new software/hardware growth, THAT'S what really makes this xTOS
>system worthwhile!

Emulation may be an option expecially if the computer is fast enough to
do this.

>A faster computer isn't what we really need so much as revived growth, but
>the main question is... HOW do we get that to happen?

Well no, I think a faster computer is needed. I can tell when I try to
do things like displaying graphics or printing. I do agree that more
should be done than just giving us more speed. More support would be
great and more updates with the computer and software...

Yes, I think you are correct. I was they would give us the option to go
under secure if we want to. They only way to get tot the secure mode is
to go through the un-secure mode.

Indeed, and I trust buying directly from Fredi more than some dealers here in the US. If the machine appears I'll evaluate the situation at that time, wether there is a US distributer is not that important. Sure it would be nice, but not critical. It always comes down to how bad you want something. ;-)

Unfortunately, it's been at this stage (at least according to Cortex/Core/Titan) for a couple years, at least. This is why I hate it when companies give specific release dates, like they have in the past, when they simply can't promise that it will actually happen. However, I do hope this project is completed, because I believe that any future development must happen on a new CPU family due to the stopped development in the 680x0 arena, and PPC is my current favorite.

On the CT60 side, I like this card, too. But I do think it's kind of bad on Rodolphe's part to insinuate something negative because he has a picture of the card on his website and Cortex doesn't. That kind of thing wouldn't be considered borderline slander in "real" advertising, at least in the US. Besides, it's only recently that the picture has been put up, and as Rodolphe also pointed out, Cortex hasn't heard much from the real producer of the card as to its current status. It may or may not be further along than CT60 and the producer just doesn't want to give out too much info at this point. Or they could just be giving up. Who knows.

I think a good solution to all this might be doing what New Beat has done with their software. These companies should set up a web site with a simple table outlining each element of the cards' development, with a percentage saying how much of it is complete, and a "Total completion" percentage at the bottom. That way, people can check in on how far things have come, without the need for phony release dates, and the developer simply needs to update the percentages once a week, or whenever major jumps in development happen (shouldn't take more than 15 minutes to change and upload) instead of

answering hordes of e-mails. I think we're all smart enough to infer the cards' status by this method without having to be told by the producer that their card is better because it's further along than the other.

No problem here with the latest MiNT-net ovl. On the contrary, with
the previous MiNT-net ovl (1.84) I couldn't connect to the atack
site. It's only since I use the 1.8601 version I can access that URL
again.

Anyone know what OS xTOS plan to use? A substantial revision of TOS (hence the name of xTOS)? MiNT? MagiC?
Anyone know what the roadmap is for the Coldfire and how far it goes?
Anyone know why PowerPC hasn't been implemented yet?

If all you do is make old software go faster, any emulator can do roughly the same. What is needed is better hardware, new software, upgraded software, and...

For me to even *consider* spending $1,000+ on one (assuming I ever get this kind of money to do something like this with), it simply MUST be available in the US somewhere by someone.

Rudolph is just bragging. But at least he HAS something to show people.
Note that he also said on his site that he would not start production until
he had a 100 preorders or whatever. I think he only has 79 so far. And,
unless either he gets 21 more preorders or decides to back off his previous
statement, the CT60 is as vaporous (as far as it actually being *buyable*)
as the Tempest.

5692. Madhousenet reconnections

Newsgroup: comp.sys.atari.st
Date: 2001-12-04 18:05:03 UTC
From: george@moulder77.freeserve.co.uk
Message-ID: <9uj38fnah1@newsg4.svr.pol.co.uk>
Source record: 39762

ISP Madhousenet changed their location and telephone number from 1/12/01, and required "madhousenet.co.uk" to be added to the user-name from this date.

Three of my friends have been connected to this ISP without problem for several years by means of STING, but, in spite of altering the DIAL.SCR and DEFAULT.CFG in line with what the madhousenet helpline advised, they cannot now make connection. The new number dials out OK, and initial handshaking is initiated, but the comment "link negotiation failed" eventually comes up on the screen. Madhousenet say as far as their system is concerned connection HAS been made and it must be something in the Atari's own program that denies connection.

When I sent the madhousenet helpline a copy of the revised STING scripts used, they advised that VJC (did they mean VJHC?) be changed from FALSE to TRUE (FALSE was the original OK value) but could see no other obvious correction required. The change they suggested was tried without success. The helpline have now confirmed that the systems at their new address are Ascend Max TNT's, and suggest I make enquiries whether anyone knows of trouble between these and Atari-based systems.

Has anyone else had trouble, or are those who have unable to make it known via the news group because of their isolation?

If anyone has any knowledge of how I can get these three unhappy people reconnected, could I ask them, please, to send me an e-mail direct, as well as posting their suggested cure on the News Group.

Thank you,

George Moulder.

5693. Re: How to replace STacy HD and FD?

Newsgroup: comp.sys.atari.st
Date: 2001-12-04 18:15:22 UTC

Hi Lyndon,

It does take 3.5" SCSI drives. I certain of that. I mean look at the size of the bloody Stacy! There's room alright. ST Book on the other hand has a 2.5" drive.

Joshua.

5694. NeoN Graphix or InShape

Newsgroup: comp.sys.atari.st
Date: 2001-12-04 20:36:44 UTC
From: John Perez <jhperez@uhunix2.its.hawaii.edu>
Message-ID: <9ujc4s$g0n$1@news.hawaii.edu>
Source record: 39764

Greetings,

Does anyone have or know where I can find Neon Graphix or InShape in English, and or with manual? I would like to purchase one of these more recent packages.

Thanks,

John Perez

5696. STE's that trash HD's

Newsgroup: comp.sys.atari.st
Date: 2001-12-04 22:49:26 UTC
From: bwiltshire@cableinet.co.uk
Message-ID: <3c0e52a5.50605632@news-east.giganews.com>
Source record: 39766

Can anyone remember the STE's that worked fine until you connected a Hard drive. I seem to recall something about a few machines having a faulty chip that controlled the DMA. I think (I hope) I have got one of those here along with some very old ST's which are only fit for spares anyway . It's a long time since I removed any silicon from a mb but it would be nice to see this STE / 520mb HD run properly

Thanks for any help
Beedub

:>
:> LZH.

: Surely you don't mean in general?

I do. If you look at the docs and output of LZH/LhA programs, you'll find
a lot of Japanese names in the credits.

: You're referring to the Japanese Atari ST community, aren't you?

Mostly PC, possibly indigenous systems, too.

: I could never get hold of a working LZH depacker for my Macintosh for
: instance, but ZIP is no problem.

I've used MacLhA in the past. LhA is a more recent version of LZH/LhArc.

As an Amiga user, I know your dilemma, LhA is often misconfigured, too,
not mention LZX archives. =)

The STacy is a 3.5" drive, but it is 1/3 height, not 1/2 height. This
makes it a bit harder to locate.

There's a subtle difference between what you two are talking about.
Martin Byttebier said the correct URL is http://atack.maiva.cz/atari/amail/
which is exactly right.

The URL you emailed me about is http://atack.maiva.cz/atari/amail
(Note there is no slash at the end.) When you use this URL, it redirects
you to the correct one. As I said in my email to you, I created a new bug
in the redirect code in 1.86, which is what you ran into. If you go straight
to the correct URL and avoid the redirect, you will have no problem. Also,
I am uploading 1.8602 with the fix in a few minutes.

Source record: 39780

Download -> http://highlandsun.com/hyc/ovl18602.tgz

The overlay is now at version 1.8602. There are 3 separate bug fixes here:
Thanks to Jorgen Nyberg for pointing out the problem connecting to
www.frontier-systems.de - this bug arose when I migrated to the new
mintlib. The overlay was spitting out lines with '\n' terminators
but they
are supposed to be "\r\n" terminators. (The old mintlib stdio
defaulted
to text mode and handled this automatically, now I've set the
default to
binary mode but forgot to fix this. It's all good now.)
Thanks to Martin Taranskeen for pointing out the problem connecting to
http://atack.maiva.cz/atari/amail - this was a new bug from some
work
I did rewriting the way redirects are handled, to re-use the current
connection if the redirect points at the same host. It sometimes
didn't
flush the connection properly before re-using it, depending on the
order
it parsed the redirect headers.
Thanks to Martin Byttebier and Markus Lutz for pointing out problems
downloading .tar.gz (.tgz) files, among other issues. The overlay
now
will only decompress a file if its MiME type is text/*. As long as
the web
server is properly configured and marks these files as binary files,
they
should be left alone.

I have checked out every problem URL that was reported to me and they are
all working with this version. If you find any other problems, please email
me.

> ST can't find the scsi adapter?

ICD Link 2 in stock. What drive are you using? Has this setup worked
previously?

Using ICD Pro the ST don't ' find ' the Link 2, it uses it to ' find ' the
attached hard drive using driver software, e.g. ICDboot.

Try another drive known to work, check the cables, jumpers and termination.

ICDboot will tell you the type of drive if it finds it, if it don't it ain't
found the drive.

Hi,

Maybe You should try the new CAB.OVL available on Dan's website:

------------------------------ schnipp ------------------------------

------ Forwarded message. ------
Originated by Dan Ackerman <baldrick@netset.com>
Date Sun, 2 Dec 2001 23:13:30 -0500 (EST)
------ ------

Sorry about sending this here, but I figured it was one of the quicker
ways for me to get the word out to you guys. (My news access is basically
down again except for scanning it)

Basically it's just one small change that allows you to log into sites
like the Yahoo Groups page. The problem was they now force the connection
over a https connection and that was conflicting with a test in the
CAB.OVL. It's fixed for that now and works to log into Yahoo Groups.

Version is 1.4401
Full package is available (however I onlyr really updated the plain text
doc file)

http://www.netset.com/~baldrick/ovl.html

Thanks and please spread the word,

Dan Ackerman
aka baldrick@netset

------------------------------ schnipp ------------------------------

Ciao, Eick

The text editor Qed can do this for you. Can be found on the Belgian
ftp-server ftp://chapelie.rma.ac.be/atari/editors/

Also you can use a-to-z. This app sort lists alfabetical and you can
save the result. http://www.mypenguin.de/prg/

Whew! The Year-End Issue is just about done... Just a few more details
to work out. It'll be going to the printer next week and I'll begin to
send them out the week of the 17th. Don't forget to pre-order before
December 14 for $16.95! This price includes FREE SHIPPING!
http://www.ataritimes.com/specialfeatures/2001_YearEnd.html

I've made some updates to the site which include:

* NEW! Updated the 2001 Year End Issue page with a
graphic of the COLOR Title page and the Contents page.

* NEW! Fruitman covers the 'Atari Conspiracy.'
* NEW! Infiltrate review by Jess LaFleur.
* NEW! Updated pricing for Adopt-a-page.
* Revisit EuroSoccer Review for Lynx.

Don't forget, TAT is always looking to PAY for articles and reviews. So,
send them in now! They might even appear in the 2002 Year End Issue!

Thank you for showing your support of TAT!

About chip, it's possible, because if i remember it was a 68HC705, which
start to be a little old...
But the mouse and keyboard used by Quertyx are a little old too, because
now all keyboard and mouse are PS/2, and perhaps USB one day...

But i didn't know that Quertyx will no longer be produced....

Well the I have the remains of a 40 pin chip in a tray thing on my desk
labeled

CO25913-38
PH23-030
SH1 80

I am pretty sure its the DMA chip from my STE, and it did trash drives.

And I think they only trash some disks. I think they tested them on some
Megafiles and they worked fine. It was only when they were used
on other drives the failed.

It is the DMA that is duff. I don't know if the chip is the same as the ST
but
getting one out in one piece will be fun. I cut my old one out with snips
cleaned up the mother board, then dropped the new one in.

Dave.

Yes, Chris, NEWSie 0.961 actually. You are right, MIME is not selected
by default. I *think* I selected it first, but with my memory ... :)
Funnily enough, I often see emails with an insertion at the top saying
that "your computer doesn't understand MIME, so you won't see the complete
text"! Just who is kidding whom?

Charles.

You are dead right there. I have an Megafile 30 that works perfectly
but the problems have arisen since getting a 520mb Fujitsu on a link

I have a good hollow bit iron / desolder pump so I'm OK there.

Some old ST applications I have looked thro mention DMA buffering
might be dodgy (and there I am out of my depth) but I will change the
DMA first and see. Anyway thanks for responding .
cheers Beedub

Martin, this only works if the list has the surname first and
each entry is all on one line. If so, then it can be sorted in the
Harlekin text editor as well, by making the list into a block and
using 'Sort block'. You can even make your own sort order list -
in mine I have put caps and lower case of each letter together,
with the numerals and punctuation marks at the end, because this
is more useful than pure ASCII order.

Afterwards he can use Egale to compare the two lists.

OTOH if the line starts first-name, surname, then none of the
proposed solutions will work. It /might/ be possible to use the
column blocks in Luna to change the order (depending on how the
names are separated) but I don't think Luna has a Sort function.
However, as it can be controlled by Scripter, it ought to be
possible to write a suitable script to do this.

Regards, /Peter/

What do you have connected to it? The driver won't find the scsi
adapter on its own! Also, make sure that if you connect more than
one device to it that they have different IDs, and that the last
one is terminated.

You could also use a word processor/text editor and save it as a delimited file format and import into a spreadsheet. Then you could sort by columns on whatever info you want, such as the city the person lives in (assuming this is an address list).

Do later versions of Papyrus have the ability to do any table sorting? If so, that might work too. I haven't upgraded since 5.15.

A-Z can sort blocks as well. If all entries have the same number of lines or
if they are seperated by a char A-Z can sort them.

...

I had to replace my DMA, and a little tip is to
cut all legs on the faulty IC before you start
to desolder anything. Cut as far from the PCB
as possible, and be careful to not put any strain
towards the PCB.

By doing it this way you just have to worry about
desoldering one pin at a time, and that is not very
difficult.

I also recommend that you should put in a socket.

You ARE joking, right? While PowerPC-anything would be the desired direction, the 601 is probably well out of production as well as far outdated, performance-wise.

Jared

Yes, under Windows I have. All I get are a handful of garbage
characters at the top of each sheet of paper.

I also tried a small Windows utility called IMPRINT, that's supposed
to be able to print out many different file types, including .PRN
files. However, I get the same results as above.

A friend of mine tried to use Adobe Acrobat to convert the files to
.PDF, but the program apparently couldn't do anything with the .PRN
files either.

Anything you could suggest on the Falcon to use?

Or, feel free to take a look at the files yourself:

Ok I do have the faulty chip numbered like you say. Rather sadly the
very old ST that was going to donate has the same numbers on it.
Is it just luck which ST contains the better DMA chip?

Everyone --- thanks for your kind help especially Hallvard for wading
thro all those posts to find the said numbers - you are a gent.

Beedub

If these are printer files, I think you'll have to know what printer
they were intended for. I.E., if the PRN file is intended for an HP
Laserjet, you will get garbage if you try printing the file to an Epson.

Well, I thought you were trying to get a better quality as SCART rules
over the modulators output. I think that the Mega ST may be missing a
couple of vital signals, is it composite sync or something that isn't
there when there is no modulator?

I am not really sure. I thought there was a mention of Mint, but I
would think Magic could be implented also. I know I read something
about Power PC compatibility, but that was a while ago...

>If all you do is make old software go faster, any emulator can do roughly

Hello all,

I am just wondering if most people leave their printer on all the time
or turn it off when their computer session is done? I have an Epson
Photo 700 connected to my Hades. Everytime I turn it on, the machine
goes through some steps and cleans the printer nossels. The manual says
this wastes ink, so I was debating whether to leave it on all the time.

I missed the start of this thread so forgive me if this was already
covered, but does Dyna Cadd do 3D modelling? Specifically, I'm looking for
something to create 3D2 models on a TT030.

Thanks.

Hi,

I need sample sample files of the following file formats:

.NEO 2bit Grafik Files (NeoChrome Graphic Program)
.PI1 2bit Grafik Files (Degas File)

does anyone have such (valid) files and can send them to me???

thanks

Wolfgang

Both are actually lowres files and therefore contain 4Bit per pixel not 2Bit.
2Bit per pixel would be medres and called .PI2 in Degas.
Neochrome pictures are lowres only.

Hello Ed,

I have two printers here, one of them being an Epson. You're quite right
about it cleaning when the computer is turned on.

We now leave all printers turned off, as well as computers. The Epson is
USB,
and switches itself on when we want to print to it, which is cool.

I have the 2D version of DynaCAD, not so useful for 3D work. ;-)
Cyber Sculpt will do it, but it seems to only work in ST high.

I don't use the printer very often so it gets switched on and off when
required.

Hi John,

>Can anyone suggest a program that will alphabetize a list of names
>in a file, save it in that order and possibly be able to compare two
>file lists for extra or missing names?

What about a database? import the list into a simple table and sort it, do the same thing with the other file and then list the complete set. You'll need a database that's at least semi-relational. Phoenix and Papyrus Base both should be able to do this with a couple of mouse clicks...

Cheers from Belgium

Hi,

Anyone have good experience installing NetBSD Linux onto the TT or Falcon? I picked up a CD which is supposed to be able to install on M68K systems for $3.99 and I would like to install BSD onto my TT030, I've found notes in some readme's on the disk about support for TT's and 19" monitors and other features, but the installs on disk are really focused on i386, MacPPC, VAX, Alpha, MIPs systems and no specific M68K install, any help welcomed.

Curt

Not a spreadsheet, a database. Sorting files is easily accomplished
in any database program (I use Atariworks, myself).

As for file comparison programs, I know that they exist for the Atari,
but I do not appear to have saved one on my hard drive.

> although I can extract the attachments perfectly.

If you look at the MIME email as a text file, you can see what's
happening. The message about not understanding MIME is written so
that if the computer truly understands MIME the message won't be
posted. Then follows various other things, including text. Often,
the text is sent twice, once MIMEd and once not.

I often run into a similar problem with HTMLd emails. On one
computer, I see the HTML version. On another computer, I will either
see the text version followed by a bunch of HTML code or I will see
nothing at all, since that email program doesn't read HTML.

Yep. I stupidly gave away my STacy about five years ago, but I found
it took quite the battery to power the STacy for long. I eventually
used a wheelchair battery, which at 40 pounds weighed more than the
STacy, but did give 20 hours on a charge!

That could be the problem, since I've only got 2 Epson inkjet
printers, and I have no idea what the files were intended for since I
received them directly from SoundPool (and they don't seem to want to
talk about it).

Seems like a very limited and not too useful file format to "save"
something in if you ask me!

I turn mine off. The thing is, even if you leave it ON all the time,
if it hasn't been used for a while, it will cycle through the
"cleanup/nozzle charge" routine the first time you ask it to print
something anyway (at least my Epsons do).

Perhaps it's a simple matter of economics... Rodolphe has posted last week
that all in all up to now 100 people have expressed an interest in the CT-60.
I suppose the Tempest will attract the same interest, that's 200 people who
possibly *might* upgrade. 200 people probably isn't enough to even warrant
the production of the Tempest. And 200 people will not attract programmers
either...

Cheers from Belgium

Hi Michael,

>Then you could get a CT60 when they're released, since you seem to be
>impressed by that. It would make for a very nice machine, indeed!

Nice but limited.... that Falcon will still have slow and limited graphic capabilities, slow data transfer, no easy way to connect network card, no modern interfaces for future addons etc... One can add a graphic card and romport interface to solve the graphic and network problems, but this will raise the overall price of the machine even more, and the same applies to the Tempest card... impressive as these cards may seem to be, at the end of the day the user is stucked with an ageing computer that can not be easily upgraded and which interfaces are becoming antique. IMO the only *real* way forward is a clone.

Cheers from Belgium

I would agree. They would have been better off just creating a PDF file.

Anyway, I downloaded your files, and they don't work on an HP Laserjet 4 or Epson Color Stylus Pro either. I looked at the files in Edith, and I'd bet money they are printer files based on the Esc filled text at the beginning of the file.

It's also occurred to me, that since these are noted as printed PostScript files, maybe what you need is a Postscript printer. If you don't know anyone that has such an animal, try Kinkos or similar.

That's one thing I absolutely HATE about the Epsons (the "cleaning cycle" it goes through everytime you turn it on after it's been off awhile). Other than that, I don't like the all-in-one color ink cartridges (I'm partial to the individual color cartridges, like in some Canons and our Xerox DocuPrint).

But you gotta love the high resolution images you get out of the Epsons.

Yep, a database would also work. But people seem to be more familiar with spreadsheets, and many use spreadsheets when the proper application is actually a database.

In fact, if the list (database <G>) is small, the spreadsheet might actually be easier. LDW Power will sort the data in the spreadsheet, but I've not done this. But I have done it in Microsoft Excel. One of John's desires is to be able to check for missing or extra entries. Easily done in a spread sheet by copying all the data to the left or right of the original, and then sort only the copied info. Given the fact that if a spreadsheet were to make errors here, you'd have to wonder what other errors there may be in the programming. And I think I'd toss that program in the trash.

If John wanted to email me his file, I could play with it and see if I can sort it in LDW getting the parameter he wants.

Are there any applications that work on the TT030 in non-native
resolutions (ie. via my Crazy Dots video card)?

I've got my TT030 running so well now I'm eager to put it to work. :)

5776. help wanted with AV cable

Newsgroup: comp.sys.atari.st
Date: 2001-12-08 09:53:47 UTC
From: switchblade <xxx@nospam.com>
Message-ID: <FnlQ7.12398$fx.273384@news.easynews.com>
Source record: 39692

Hi,

I am trying to get a recently aquired Mega ST4 and Mega ST2 to work on my TV, as i dont have an Atari monitor nor do I really want the expense of buying one.

I was given this cable, which I was told was a full SCART cable and on inspection it appears to match pinouts and articles I have found on the net.

However ... I get no display from the Mega ST's (just a black screen, although I can hear the audio), but the cable does actually work with my 520STFM. I think the problem is that my TV has no SCART socket so I am putting the signal through the VCR. This works for the STFM as I said and also for my SNES and N64. From what I have read, the VCR is more of an "AV" port than a SCART port. Is this the problem? Is there any way at all to get a display from the Mega ST to the TV through an AV port?

Any help appreciated

Paul

If it works on your STFM then it should also work on the Mega ST. There
is no difference AFAIK. Have you tried to see if the video system on the
Mega is working by plugging it into a tv with the normal RF lead from the
modulator. Actually, do the Megas have modulators?

Hi

I would like to contact anyone of these. I've tried various email addresses but all get bounced back to me. I've seen Sacha here sometimes so if you're listening please give me an email or pop up here. It is about Centscreen, I know you probably don't develop it or care about developing it but I would like to ask you something about it.

Thanks.

5779. Re: Help reading/printing SoundPool's AUDIO TRACKER Postscript manual

Newsgroup: comp.sys.atari.st
Date: 2001-12-08 12:26:22 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <3c1206e04a1db0@tripnet.se>
Source record: 39699

On Fri 07-12-2001 18:23 (-0700) Ken Springer wrote:

>Anyway, I downloaded your files, and they don't work on an HP Laserjet 4
>or Epson Color Stylus Pro either. I looked at the files in Edith, and
>I'd bet money they are printer files based on the Esc filled text at the
>beginning of the file.

Actually the files are in the HP PCL language. I did some manual
translations from the beginning of ATPENGR.PRN and came out with:

ESC E = Reset printer
ESC (8 U = Character set: HP Roman8
ESC & l 6 d 7 0 P = Lines/inch: 6 + Lines/page: 70
ESC & l 0 E = Top margin: 0
ESC & l 1 X = ?
ESC & l 1 H = Paper feed from tray
ESC & l O = Page Orientation? (Portrait= ESC & l 0 O)
ESC * p 0 x 75 Y = Cursor position x=0 y=75
ESC * c 2 D = Downloaded font ID: 2
ESC) s 75 W = "Create font" followed by 75 bytes of data
ESC * c 33 E = ASCII code nr: 33
ESC (s 121 W = "Download chr" followedby 121 bytes of data

This looked promising so I simply doubleclicked on ATPENGR.PRN in my
TOS3.6 desktop to send it to a DECLASER 5100 that understands HP PCL. A
couple of minutes later all odd pages of a 57 pages manual for Audio
Tracker, very nice looking with graphics etc, is on my knees!

A few strange things though: I first tried to drag the file to the
printer icon in Magic and got garbled characters on a couple of pages
before I turned the printer offline. Then I tried in standard TOS with
FREDWEST.PRG (Printer accelerator) active. This time TOS told my the
printer did not recieve data. After a reboot with no extras att all
everything worked just fine.

I have not tried the other ATPENGL.PRN but it seems obvious that this
file will print as all even pages.

I seem to recall that you run Magic so maybe that is the reason it did
not work in the first place when you tried with a HP laser?

>It's also occurred to me, that since these are noted as printed
>PostScript files, maybe what you need is a Postscript printer. If you

Postscript files are very easy to identify by looking at the beginning of
the file.

Hi,
How can I open an *.eps file on Atari? It is a vector
graphic. Is there any program that can open it and/or
convert into any other format (preferably *.gem)?
I've tried NConvert and NView, but they cannot handle it.
I also tried Artworx and Papillon (no success) but I saw
"EPS - Encapsulated PostScript" option in ConvectorII
window. It seems Convector can only *save* in this
format though :(Is there any other program I may try?

STFM has a modulator and will work.

Mega ST has no modulator and will not work.

Mega STe has a modulator and will work.

Hei Curt.
Check which version you have. I tried NetBSD 1.5 but it was limited for graphics on an
normal
TT030. if are using HD Driver for hard drive booting do not bother, use Debian/Linux
instead.
If you would like the installation details I will download from my Wasabi version1.5.

regards

JNO

Haven't got the $500+ to buy one and really can't justify that kind of money
to such when I'd still need to pay about $300 more for the CT60. That kind
of money can pay a lot of bills for a few months... and that's about what it
all boils down to. My days of luxury more or less ended shortly after
getting married.

No more $5,000 computers for me (the cost I paid for a Power Macintosh
9500/120 when they were new)... that's for sure!

Jared

Yes, SoundPool did finally answer my e-mail about the files with the
following:

-You just have to go to copyshop or someone who has postscript
-printer to print out manual.
-We do not have any other file [format].

Seeing as I don't have a PostScript printer, I suppose I'll have to
visit my local Kinko's store for a printout.

Hi Stephane,

>I tried launching Centek's Videomod.app but this has no effects (does
>not work either under single Tos).

Yes, you will need that for use under Magic. Maybe you are not operating
it correctly. You make the screen you want with CentVidel and save it
with a name to your video.dat. Then open up videomod.app in magic and
select the one you want a click on the save button. This will set the
default screen size. You then reboot, and hey presto, new screen rez!

From: Clement.Benrabah@wanadoo.fr
Message-ID: <9utpa5som1@wanadoo.fr>
Source record: 39711

Hello,

I want just to say that i've compiled without any change the X versions
of Stella (2600 emulator) and Atari800 (the famous 8 bit emulator)
and they seem to work under Mint and the X GEM server.

But it's too slow on my Milan 40 at 25Mhz (especially Stella).

So perhaps happy owners of a 060 machine will be interested in knowing that
in order to play old classic games.

If someone want to test Stella, he can contact me, i've still the binary (1214 Kb).
(the c++ compilation needs more than 30 Mb of memory !)

I wish there wasn't a full GEM version of Atari800 that runs on the clones...

Congratulations to Franck Naumann, Guido Flohr, Ralph Lowinski and all the people
that work on the Sparemint project: they are doing great works !

Clement

Well, you'd get a slightly better signal if you use the composite "AV"
output of the monitor port instead of the RF signal.
However, the composite pin of the monitor port is connected to the RF
modulator. If you haven't got a modulator, you haven't got any composite
output, either. And since your TV doesn't have SCART, it won't display the
RGB input, either.

I would doubt it - both of these are 16-colour ST-Low resolutions.
However .PI2 would be 4-colour, i.e. 2 bits (and .PI3 mono/1 bit).
AFAIK Neochrome did not work in 2-bit (of course you could use
just the 4 colours, but it would still be saved in 4-bit).

At least Ken Medin got them to print on his DEClaser.

I also tried drag and drop with TOS (Hades 060) and I got Error 22 on my Laserjet. I wonder if his DEC is a postscript printer also, since it seems Soundpool confirms it's a postscript file.

There is the possibility I have a bad printer cable attached to my Hades. DynaCADD also will not print, and I get the same error. But I've never taken the time to change cables and see what happens. The cabling also goes through a couple of switch boxes also.

Try XChange from Eines Computing if you can find a copy.

I just couldn't leave this alone, I had to get to the bottom of it just out of cussed curiosity. <G>

Ken Medin is correct, it is an HP PCL file. I went digging in my Windows 98 books and found out how to do the Windows 98 equivalent of "dragging and dropping" a file on the printer icon in TOS. I learned... you can't. Gee, does that surprise you????

But it can be done in other ways, and it printed. The only problem I had was the printer kept asking for A4 size paper, like I have reams of the stuff in Colorado. <G>

I really ought to finish reading that Windows 98 book! LOL

That of course depends on your point of view and what your goal with the machine is. For example, I use my Falcon for music with use Cubase Audio. While Cubase won't work on either of these upgrades, they can at least be turned off, letting me still run Cubase. I could then turn them back on for a large burst of speed (relative to the Falcon's speed). A clone wouldn't be able to run Cubase Audio, and while I could talk my wife into letting me have the two computers (Mac and Falcon), a third (especially another Atari-compatible) would be pushing it, I think, and for the compatibility level it would offer, I could probably get a better machine using MagicMac on my G3 iMac. As for graphic capabilities, I could get a graphics card and make a switch to go back and forth between Videl and the card (like Eclipse), and for networking, it's hopefully only a matter of time before Mario Becroft's SCSI ethernet adapter is finished. I don't really need anything beyond that at this point. So for me, a clone wouldn't be very useful, where a CPU upgrade card would. I would have a little more flexibility and backward compatibility all in one machine than I would with a clone (unless someone came out with a PPC Falcon clone that could still run Cubase Audio - fat change with that, though). However, for someone who is upgrading a TT, where backward compatibility with ST or Falcon isn't an issue, then a clone would be the best thing, I agree.

Note that the files in question are NOT in Postscript format! They are HP PCL printer commands captured to files.

This might seem a little confusing as the DEClaser actually is a postscript printer. But it also has a PCL interpreter built in which I normally use both when printing from the Atari and pc.

>I also tried drag and drop with TOS (Hades 060) and I got Error 22 on my

Soundpool simply is wrong! But, on the other hand if you speak latin it's a "post script" file meaning it's suited for printing later on :-)

You could try to simply print some text _with_ some 8bit characters in it like ï¿½ï¿½ï¿½ so all 8 parallel lines come to use. Why not this text...

Or you could use any pc and enter the proper DOS commands to send a file to the printer.

Well, you actually can find them cheaper if you keep your eyes open. I
bought the one I have now, complete with CD-RW, Nemesis, and software, for
$400. And I sold my C-Lab Falcon to a friend for about $200. I've seen them
as cheap as $150.

I can understand that. My wife and I just had a baby, which severely limits
things, too. But you can get good deals if they're important to you and you
keep your eyes open for them.

Hi Paul,
If you can find a piece of hardware called Video Key it gives 4
separate outputs for the SC1124, Video, Audio and TV however my unit
(which I'm not ready to get rid of) gives a lousy TV picture but it's
at least useable in an emergency!

There exist a nice application called ï¿½gale with which you can compair two files.
You can find it on:
<URL:http://reitter-it-media.de/software/egale.html/SiCoPS/lang_en/SiCoPS.html>

or on <URL:ftp://chapelie.rma.ac.be/atari/utilities/egale41d.tos> latest German version
<URL:ftp://chapelie.rma.ac.be/atari/utilities/egale40e.tos> English version

Ghostscript will do this for you. You can't save the eps file as gem
though. I believe GS can save in png, tif, img and jpg.
GS can be found on every ftp-server which holds an Atari section.
ftp://chapelie.rma.ac.be//editors/ghostscript/
-rw-rw-r-- 1 ftp 1437413 Mar 29 2000 gemgs13-bin.lzh
-rw-rw-r-- 1 ftp 912312 Mar 29 2000 gemgs13-doc.lzh
-rw-r--r-- 1 ftp 12777 Feb 24 2001 gemgs13-en.lzh
-rw-rw-r-- 1 ftp 684859 Mar 29 2000 gemgs13-fnt1.lzh
-rw-rw-r-- 1 ftp 1184175 Mar 29 2000 gemgs13-fnt2.lzh
-rw-r--r-- 1 ftp 13552 Feb 24 2001 gemgs13-fr.lzh
-rw-rw-r-- 1 ftp 923 Mar 29 2000 gemgs13-ger.txt
-rw-rw-r-- 1 ftp 923 Apr 3 2000 gemgs13-ger.upd.txt
-rw-rw-r-- 1 ftp 560097 Mar 29 2000 gemgs13-lib.lzh
-rw-rw-r-- 1 ftp 65936 Mar 29 2000 gemgs13-src.lzh
-rw-rw-r-- 1 ftp 3928 Apr 3 2000 gemgs13-upd.lzh

You need fnt1, fnt2, bin and lib. This is for the German version.
If you want an english version you need gemgs13-en.lzh too.
Not sure but probably you need upd too.

Furthermore the good old Arabesk 2 is able to read eps files and convert
then into a more suitable format susch as gem, aob, cvg and ai.
Arabesque was once a very good commercial prg. I don't think it's still
available. AFAIK it's German only.

TTFN,
Martin

Go to http://www.netbsd.org/Ports/atari/ for more info on the Atari version.

I installed Linux on my plain 4/4 TT and it works fine but's an older
version. I just had a 8 meg TOS partition, a Linux partition and a Linux
swap partition and clicked on the installer program and an about 1 1/2 hours
later booted into Debian Linux. I had a 1X CD-ROM drive otherwise would
have been quicker.

5815. Magic and extended screen modes on Falcon

Newsgroup: comp.sys.atari.st
Date: 2001-12-09 18:31:27 UTC
From: stephane.montarsolo@free.fr
Message-ID: <3c13adfe$0$198$626a54ce@news.free.fr>
Source record: 39736

Hello everybody

I am using a Falcon fitted with a CT2A accelerator board. I recently installed Magic 6.1, considering it was high time to get into multitasking operating systems. Everything fine so far (with the help of the french Atari newsgroup - sorry to be French) except one thing :

I became used to having available extended screen modes on my Falcon (640*480*tc or 800*600*256) under single Tos using Centscreen (uses well the extra capacities of the CT2 board), but now, under Magic, I have not yet found a way to use thoses. The only thing I got so far is Centscreen running with a Standard video mode (I know because I got the screensaver feature kicking on) but I have been unable to change screen modes or even boot into an extended mode. I am up to now using magxdesk as desktop.
I tried launching Centek's Videomod.app but this has no effects (does not work either under single Tos).

Anybody succeeded and got the "magic" recipe for it ?

Thanks a lot for any idea.

Stephane Montarsolo

I know what you mean. I researched printing .PRN files in Windows,
and found information on the Microsoft site. However, it also didn't
work. And I too was just a "shocked" as you were! <hahaha>

>But it can be done in other ways, and it printed. The only problem I
>had was the printer kept asking for A4 size paper, like I have reams of
>the stuff in Colorado. <G>

All is not lost!

After Kenneth's clarification on what the files actually were, I also
did some searching, and came up with a few programs that claimed to be
able to convert PCL to PDF, as well as print. A couple that I found
did correctly display the manual, but put it's own "watermark" on the
page when printing it out (and it wasn't small either!). And they
want something like $400 - $1500 for the software!!! Hmm, let's
see... I paid $68 for Audio Tracker, and $1500 to learn how to use it!
I don't think so!

But I did more searching, and finally came up with a free program
called "FORMVIEW". I can now view the manual, and printing works as
well - although I had to mess around with the software to get it to
scale the pages a little bit, since they weren't fitting entirely on
the page. Like you said, it's most likely because the manual is
originally intended for A4 size paper, whereas "letter" is the
standard size here in California! But I think I've worked out that
problem too. I'm going to try to print out the whole thing today.

>I really ought to finish reading that Windows 98 book! LOL

Ha! I've got a couple here on the desk you can look at when you're
done...

Thanks for all the input and help guys!

Shareware or demo versions of the software, I'd bet. I don't blame the producers of the programs for that.

FYI, if for windows you want to create a PDF file, there is a program called PDF Factory that installs itself as a printer driver, so you can create a basic PDF file as long as the software lets you select your printer driver. All for $50 US

Letter is standard in the US, A4 in Europe.

You know, since the PCL file can be loaded into an Atari text editor where you can edit the entire ASCII character set, I wonder if you could translate the page size codes from A4 to Letter and have the manual print out.... A lot would depend on whether there are page headers and footers I would think.

> >I really ought to finish reading that Windows 98 book! LOL

Hi John!

As I said before, Egale (shareware) lets you compare two files and
even 'equalize' them automatically if one has some additions (by
inserting blank lines in inverse video in the other file). The
only thing to bear in mind is that the comparison works linewise
(or in binary) so if line-breaks change the lines will not be
recognized as equal.

Hi Martin!

I don't think he needs the fnt2 file (the author mentions this). I
must say that I have had problems with gemgs13 - in many PDF files
I tried it only shows the first few pages. The older gemgs12 on
the other hand shows them OK. Haven't trieds any *.eps files
though.

As far as I know A4 is smaller than letter so there shouldn't be a problem
(except fewer sheets used using letter in a large document).

There's only a few days left to pre-order your copy of The Atari Times 2001 Year-End Issue! This 100-page issue includes the years best from The Atari Times website as well as over 15 pages of new material and articles! Also, a color-cover will be included. You can see for yourself by going to http://www.ataritimes.com/specialfeatures/2001_YearEnd.html

Only 50 copies of this special issue will be printed, so make sure you guarantee yours by preordering by December 14. The preorder price is only $16.95! And don't worry about shipping, it's included in the issue price.

http://www.ataritimes.com/specialfeatures/2001_YearEnd.html

Thanks for supporting The Atari Times!

5823. FS: Falcon w/Afterburner 040 + MiNT + Software

Newsgroup: comp.sys.atari.st
Date: 2001-12-10 04:47:19 UTC
From: Michael White <michael12@mindspring.com>
Message-ID: <9v1env$3qg$1@slb0.atl.mindspring.net>
Source record: 39744
Cross-posted to: comp.sys.atari.st,dfw.forsale

All,

I'm offering the following Falcon system for sale.
All hardware is in excellent working condition EXCEPT for the native video output of the Falcon. There is a slight blue tinge that comes and goes. This blue tinge is not present on the video card output.

$1000 or best offer. Price does not include shipping.

Included hardware
---
o Falcon 030 in C-LAB MK-X Case
o 1.2 GB Internal Toshiba IDE hard drive
o Afterburner040 w/hardware switch to switch back to 030
o 36 MB RAM (4MB on board, 32MB on the Afterburner040)
o Nemesis accelerator
o Nova 64-bit graphics card with 2 MB VRAM
o QWERTYX AT keyboard/serial mouse adapter mounted internally w/hardware switch for compatibility
o Mega STe keyboard
o Microspeed keyboard
o Mouse
o Motorola 28.8 external modem
o External monitor switch for Nova/Falcon video output
o All necessary interconnecting cables and power supplies
o 4.3 GB Internal IBM SCSI hard drive. This is currently house in a case, and is required in order to boot MiNT.

Commercial Software
---
o NVDI 4.11
o Papyrus Gold 3.64 with 4.25 upgrade
o ProCopy ST
o SpeedoGDOS
o XBoot III
o Atari MultiTOS (upgraded)
o CAB 2.7
o CD Font Manager ST
o Extendos Pro
o Extendos Gold
o HD Driver 7.11 with 7.71 upgrade
o Thought - Idea processor (design tool)
o AtariWorks
o N.AES 2.0

o Straight Fax 2
o Flash II
o Bird of Prey CD (Floating Fish collection of Falcon stuff)
o Expert Software 2000 Fonts CD
o Bitstream 500 Fonts CD
o Selected Signs Font CD
o Speedo Superfont
o Wercs Resource editor
o Cleanup ST
o CD Writer
o GEMTrade German translation program
o MicroRTX
o ScanX scanner software
o UVK 2000
o MegaPaint CAD tool
o Radical Race (game)

Registered shareware
---
o Paula mod player
o CLA Digitial Circuit Designer
o Thing 1.27
o ANIPlay
o Others, I know....

Other software
---
o MiNT installed across both disks
o MiNT 1.12 currently running
o RPM installed
o SSL version of Lynx installed

I can be reached via email at michael12@mindspring.com, or you can
reach me by phone at 817-427-2129 in the evenings.

Thanks.

All,

I'm selling the following commercial software development
and license (yes, you can update these and sell them within
the terms of the agreement). Includes source code, user
documentation, and directions on how to build.

Includes all necessary tools to build.

$300 or best offer. Price does not include shipping.

Packages
----
o Diamond Back
o Diamond Edge

Included commercial software
----
o Lattice C 5.6
o Iface Color Resource editor

Books
-----
o Best Electronics catalog
o Atari Compendium
o The ST Assembly Language Workshop
o Introducing Atari ST machine code
o MC68030 User's manual (Motorola)
o MC68040 User's manual (Motorola)
o MC68060 User's manual (Motorola)
o 68K programmer's reference manual (Motorola)
o ST Disk Drives
o Atari ST Internals
o Atari ST: VDI

I can be reached via email at michael12@mindspring.com, or you can
reach me by phone at 817-427-2129 in the evenings.

Thanks.

5825. TT keyboard/Znet

Newsgroup: comp.sys.atari.st
Date: 2001-12-10 06:59:57 UTC
From: Dennis Bishop <hakaida@earthlink.net>
Message-ID: <N3ZQ7.64$5K4.14232@newsread1.prod.itd.earthlink.net>
Source record: 39596

I've had a very bad year this last year, what with my car giving out and other things happening. So I hope this next year will be better, so to get one the right track, I need two bits of hardware and a isp question.

1st, I'm still in need of a keyboard for my TT, I've been able to use it to put files on floppys via UISIII, but I can't type with it. A guy offered me a keyboard last year in trade for the old one and $25.00, but when I e-mail him about getting his address for shipping, I never got an answer back. As I live on a fixed income budget, I have to plan up to 60 days ahead.

I also need a power supply for my Falcon or a good clear set of plans to turn a pc power supply into one for a falcon.

and then I need to know, has anyone ever got a Atari machine on the Znet ISP? I know of another one I've contacted and the TT could get on their system using the PPP setup, but as Znet is a bit cheaper, I'm wondering about them.

5826. Charming Chaos Month

Newsgroup: comp.sys.atari.st
Date: 2001-12-10 07:03:01 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0112092303.3747396f@posting.google.com>
Source record: 39597

Hi All

This Month at the Atari-MIDI mailing list we are covering Electronic Cows great algorithmic application called "Charming Chaos". So far we are covering some ground with some uploads and information as we are learning this application as a group. I would welcome anyone here to join us as well.See signiture for link to the list. We could use more input.

If you have not tried this wonderfull program, now is the time. You do not need to be a musician to get something out of it, but by tweaking parameters can come up with some cool stuff.Here is some info as well as the download link on ECows site.

==========
Charming Chaos

Charming Chaos is an algorithmic MIDI sequencer, with a built-in DNA Seed Construction tool that enables you to create your own algorithms. Music composed in Charming Chaos can be recorded in real-time to disk as a type 0 MIDI file, ready to use in your favourite MIDI sequencing package for further editing. If that's not enough, Charming Chaos also runs as both a desktop accessory and a standalone GEM program, so you can run it at the same time as another sequencer.

Main Features:
4x4 note polyphonic parts
10 programmable DNA seeds
Scale /velocity/ MIDI controller groove mapping templates.
Internal/external MIDI sync.
Real-time MIDI file recording
Programmable MIDI mixer
Portemento/program change and MIDI channel settings
Real-time MIDI input modulation.

Requirments:

Tos1.02-4.04 STFM, STE, TT, Falcon
1 Mb of memory (more may be required when run as an ACC.
640x480 display

(ST HI, TT MED, TT HI, Falcon High color modes.
Will not work in ST MED or Low.)
MIDI Module required. MIDI input source recommended.

Upload section for the Atari-MIDI mailing list: Charming Chaos MIDI files and DNA seeds. The TXT file of the manual is also there:

http://groups.yahoo.com/group/atari-midi/files/AOTM/DEC2001_CHARM/

Web page at Electronic Cow:
http://dspace.dial.pipex.com/electronic_cow/chaos.htm

Download:
http://dspace.dial.pipex.com/electronic_cow/software/chaos.zip

The manual:
http://dspace.dial.pipex.com/electronic_cow/manuals/chaos.htm

==========
Hope to see you at Atari-MIDI!

5827. CT2b help needed

Newsgroup: comp.sys.atari.st
Date: 2001-12-10 07:09:12 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3C145F98.A8BE5DC7@siemens.at>
Source record: 39598

Hi,

Last weekend I opened my Falcon tower because the noise of the fan
got unbearable (some loose cable seemed to have got in its way).
After finishing work I now have a (relatively) quiet machine
again but now the CT2b turbo mode doesn't work anymore.
When I boot in 'normal' mode everything works fine (didn't remember
how slow it is) but when I boot in 'turbo' mode I only get the
CT2 help page. I even tried to write the flash RAM new but that
didn't help.
Any suggestion what else I could try ?

Thanks
Gerhard

5828. Re: CT60 news

Source record: 39628

DV>Nice but limited.... that Falcon will still have slow and limited
DV>graphic capabilities, slow data transfer, no easy way to connect network
DV>card, no modern interfaces for future addons etc... One can add a graphic
DV>card and romport interface to solve the graphic and network problems, but
DV>this will raise the overall price of the machine even more

I bought my falcon in 1994 (sold my MSTE to afford it), then bought a NOVA graphics card in 1996, *this* year a networking card was added to my equipment and hopefully next year the CT060 will be available so I can upgrade my falcon again.
Don't you agree that although the updates were rather expensive compared to PC market prices in the end I saved a lot of money by using such an old computer?

DV>only *real* way forward is a clone.

For new users this might be correct but when did you last see a *new* ATARI user?

Tschuess,

Frank

From: stephane.montarsolo@free.fr (Stephane Montarsolo)
Date: 09 Dec 2001 18:31:27 GMT

>Anybody succeeded and got the "magic" recipe for it ?

Although I'm able to adjust screen sizes and all that, it's totally useless
for me. Part of the screen gets duplicated at one edge of the monitor, and
there is pixel garbage at the bottom of the screen.

I therefore use Videlity. It's supposed to be free these days, but I'm
afraid that I don't know where you can download it from.

Cheers

Oh :-(

>how slow it is) but when I boot in 'turbo' mode I only get the
>CT2 help page. I even tried to write the flash RAM new but that
>didn't help.

I think that one of the settings in those pages is to bring the "help" page up each time when you boot up - perhaps you should look through all the pages.

You might also try resetting the NVRAM. You must boot into "Normal" mode to do this and to use the BIOS flasher.

Hope you get it fixed!

Cheers

From: Michael and Nicole Freeman <nameerf@flash.net>
Date: Sat, 08 Dec 2001 22:12:53 GMT

Hi Michael,

>A clone wouldn't be able to run Cubase Audio, and while I could talk my
>wife into letting me have the two computers (Mac and Falcon), a third
>(especially another Atari-compatible) would be pushing it,

I could try to be the wise guy and tell you that one can add a STarTrack
card to the clones and enjoy using Cubase Audio, but then you'll probably
will ask where these cards can be obtained from.
As for your wife, you could explain her in a very calm but decisive manner
that there are more women then Atari computers on this planet <grin>

>I could get a graphics card and make a switch to go back and forth between
>Videl and the card (like Eclipse), and for networking, it's hopefully only
>a matter of time before Mario Becroft's SCSI ethernet adapter is finished.
>I don't really need anything beyond that at this point.

True, but the point was that the clones already have a graphic card and are
able to do networking. I'm not sure but from reading the specs I have the
impression that the Deesse card will be able to run Cubase Audio and other
Falcon specific software as well. So, then it would only cost $150 extra
to turn these clones into a "Super Falcon". If this works, then you don't
really need the Falcon anymore, so you could sell it to Jared <fat grin>

>I think, and for the compatibility level it would offer, I could probably
>get a better machine using MagicMac on my G3 iMac.

Probably, but for someone who hasn't got a G3 of G4 yet, the clones would
be cheaper and even more compatible. And for MiNT users MagiCMac isn't a
solution at all... it's their worst nightmare ;-)

>I would have a little more flexibility and backward compatibility all in
>one machine than I would with a clone (unless someone came out with a PPC
>Falcon clone that could still run Cubase Audio - fat change with that,
>though).

Just suppose that....
One will be able to fit the Tempest card by means of an adapator in a TT,
MegaSTE etc.., from a technical viewpoint I think (?) it shouldn't be a
problem to build an adaptor for the Milan and Hades either. That piece of
hardware would tranform the clone with a fitted Deesse card into some kind
of PPC based Super Falcon, bringing us back where we started: the only real
way forward is by means of a (available) clone.

Cheers from Belgium
Dennis

Hi Dennis,

>1st, I'm still in need of a keyboard for my TT, I've been able to use it to
>put files on floppys via UISIII, but I can't type with it.

If you don't mind a sticky key (letter V) then I've got an intensively used
one here for you :-)
Just mail me...

>and then I need to know, has anyone ever got a Atari machine on the Znet
>ISP? I know of another one I've contacted and the TT could get on their
>system using the PPP setup, but as Znet is a bit cheaper, I'm wondering
>about them.

Yes...
Robert King, James Haslam, James Smith to name just a few use ZNet. I know
for a fact that it runs with IConnect and STiNG. So no problems... :-)

Cheers from Belgium
Dennis

5833. Old Atari ST games

Newsgroup: comp.sys.atari.st
Date: 2001-12-10 17:50:49 UTC
From: SuzieQ <scorpiosuzy@yahoo.com>
Message-ID: <3c14f3e6_2@corp-goliath.newsgroups.com>
Source record: 39599

Hi all

I have some old Atari ST games sitting at home and if I don't give them away
I'm going to bin them.

I'm in the North London area but takers could potentially also collect from
the Teddington area if more convenient.

Contact me direct on scorpiosuzy@yahoo.com if interested.

Have you tried to convert the unreadable pdf's into ps? The GS package holds a utility calles pdf2ps.ttp which like the name suggest convert pdf into ps. Once converted into ps I found that many pdf's which caused troubles were fully readable.

TTFN,
Martin

Hi Martin!

No, I haven't - will do next time I have problems. But as I say,
V1.2 manages them fine for some reason. But I will register
Porthos soon as on that one can choose which PDF pages to print
out. In theory this should be possible with GEMGS as well, but
mostly I can't get it to work and if something goes wrong have to
start printing from the start again...

Hi all,

I just updated my web pages at http://eiffel.atari.org with
addition of somes pictures of first items poduced, but currently
for french user in order to perform somes real tests and be sure
all is ok.

Project is completed, just need somes tests...
Sure you can, if you want, try to build your own board and test it,
it's free. Commercial use is autorized, i think it can help somes
users which like to talk with distributors and get professional quality,
but i like the free "idea" as Linux does, and so i keep this project under
free licence to allow anyone to do what they want. But free dosn't say
that commercial idea isn't allowed, simply a that the core of Eiffel (PIC
program) can take place into a commercial product.

A4 paper is narrower than letter, but longer than letter. It's like
8.25 X 11.5 or similar. I'm just too lazy at the moment to get the
exact dimensions.

Yes, you are right. There might still be a problem with page
breaks though - depending on whether the original file contains
form feeds or not. I only have experience of it the other way
round: I had a friend print out a long TTF specs file written in
MS Word on A4 that was intended for Letter paper and that left
some paragraph headers as widows and some images were on the wrong
page (and some didn't print at all!).

Regards, /Peter/

I see. I didn't realize this. I was always under the impression that Cubase
Audio was very picky, and needed the specific hardware design of the Falcon,
which is why it doesn't run correctly with a lot of Falcon upgrades (some
types of memory, new CPU's, etc) without turning them off and running in
"classic" Falcon030 mode. If it did, then I'd get rid of the Falcon in a
heartbeat, and get a Milan and the Deese card. Then as far as I'm concerned,
Jared could do as he likes with the Falcon! :)

Anyone worked with MacMint? How well does it work? Does it run Atari
software (if used with NAES, AES 4.1, XaAES, or whatever?) or does it only
run Mint-only software? In otherwords, does it have any use at all? ;)

If what you said about the Deese card being able to run Cubase Audio is
true, then I agree with you 100%! I'd love to have a Falcon-compatible clone
like this! Thanks for the info! I hope it's true!

That's the first thing I did, but I found no way to exit the 'help'
page even after going through all pages.

> You might also try resetting the NVRAM. You must boot into "Normal" mode to
> do this and to use the BIOS flasher.

I tried to update the flash with PUTFLASH utility and I also tried
another utility where I can't remember the name at the moment
where one can enter NVRAM parameters like language and keyboard type.
Neither of them gave any error message but when I tried to go to
'turbo' mode again it was the same 'only help page' system again.
Is there anything on the boot partition that's needed at that early
stage ? I don't think so but maybe I'm wrong.

Thanks
Gerhard

Hi all,

I want to read/set the 256 color palette on a Falcon for a program I
am writing.
Looks like I can use the xbios functions 93 (VsetRGB) and 94 (VgetRGB)
for that....
But how do I actually use these calls? All I get is 2 bombs...
I'm programming in GFA basic.
Any help would be greatly appreciated!

Guido

1) If you don't have a modulator then you don't get composite video out from
your ST.
So plain ST's (as opposwed to FMs or E's), and plain Megas don't have any
composite.

2) The SCART sockets on most video recorders only accept composite. Often
the manuals
are not clear on what they do accept.

3) External Modulators were available for the MEGA, (I have one) and these
also have a composite
out, so if you can find one of these you will be o.k.

Dave.

Wouldn't be better to use:

1) VDI calls - if program have to be system-clean
2) direct mem acces - if program does not need to be clean

Hi,
It doesn't need to be clean - Falcon 256 colors only. How do I know
where the palette is located in memory?

Guido

Forgot to tell: I have the palette in rgb format...that's why I choose
those 2 xbios routines...

Exactly my opinion too. And with the CT60 you will have a faster
computer than any of the clones is and a 100% compatible one too.

> DV>only *real* way forward is a clone.
>
> For new users this might be correct but when did you last see a *new* ATARI
> user?

What does any of the recent clones offer that a PC does not ?
That's why I use a PC for everything that none of my Ataris can do
and the Ataris for everything else, which is most things I care to
do :)

Would anybody be interested in buying a Mega ST 2? I also have a Mega ST 4 which has a few upgrades, but I'm not sure if I want to sell that :)

I am open to offers - post replies here.

>demo of it, but at least Videlity works!!

Hmm, Videlity never reliably got big screen rez. I've managed 1280*800 in
4 colours easy with Centscreen, and little slow down IIRC. Useful for my
CAD work.

>problem too. I'm going to try to print out the whole thing today.

Well, I've just finished printing the whole manual! However, it DID NOT go as easily as I had hoped...

Yes, the freeware program "FormView" did display all of the pages, but not all of them were displayed correctly. There were a lot of font problems. These really showed up when attempting to print the problem pages. It seems that FormView incorrectly interpreted some italic and bold characters, and instead displayed them as normal fonts, but several point sizes larger than they should have been. This of course caused text to run off the edges of some pages, on top of images within the document, and resulted in a great deal of lost text as well. Often I couldn't even read parts of the pages, since text was on top of other text; and that was all important information that I needed to see.

So, I found yet another DEMO version of a Windows program (called EscapeE) that deals with PCL files. I had to fill out a registration form online, but as a result, it unlocked most of the features of the demo for 30 days. Unfortunately, as far as I could tell, it didn't have the same re-sizing options as the much simpler FormView, so the A4 pages - while correctly displaying and printing with regard to the fonts, were too large for the Letter paper I'm using. By the way, it also put a "watermark" on the top of each displayed & printed page, although not as intrusive as the other software I tried earlier ("PCL Tool"). But what do I expect for a free/demo, right?
;-)

The good news, is that I was able to export to another file type, albeit with the watermark intact. First I tried exporting to PDF. The files then displayed correctly in Adobe Acrobat Reader, but printing was still an issue due to the A4 size. So I exported the PCL files to TIFF images. I then loaded them into a great little freeware image processing/viewing program I have called "IrfanView". I was able to resize the images enough so that, while the page numbers at

the bottom of each page didn't show, all the important information did. I then used IrfanView to print out the pages that FormView couldn't get right, and after a few hours of work, I've got my Audio Tracker Manual!

Whew! A little White Out over the watermarks, and I'll be done.

Thanks again everyone for the help!

Well, due to my amazing stupidity I owe an appology to everyone whose
time I stole with my stupid question. Although it's still a mystery
why the help pages popped up suddenly after using the CT2 for so
long, the simple solution was [SHIFT][F9] and after resetting of
several parameters now everything works again. I had tried all
function key before but not with [SHIFT] pressed additionally.

Thanks to all who tried to help
Gerhard

In the german distribution which I use, unfortunately, this information
is not given on the last line but somewhere in the middle of the text.
That's why I overread it several times when I 'quick read' the text
for such an information. But last night I found it and now everything
works normal again.

many thanks

Source record: 39645

Hi!

I just received a Stacy (i�ve never had an Atari before). So when i turn it
on, no Harddisk is found.

I also got the following floppy disk:

o)Auto
- AHDI.PRG
- FOLDR100.PRG
o)HDX
- HDX.PRG
- HDX.RSC
- SHIP.PRG
- WIW.CAP
o)HINSTALL
- COLDBOOT.PRG
- HINSTALL.PRG
- HINSTALL.RSC
- SHDRIVER.RAW

When i start HINSTALL.ORG and then COLDBOOT.PRG - i get the HD symbol and
can
access the HD.
But when i turn it off and on again the HD is gone.

So, what shall i install (and where or how :) so that every time i boot, the
HD is visible ???

(You see - i am a total newbie)

thank you for your help

Klaus

There are 5 AC Greens in Hobart phone book, but I know his postal address is PO Box 1190, Hobart, TAS 7001. So you could try Telstra enquiries. He has recently issued another Fujination newsletter, but rarely replies to emails!

Hi Lyndon,

>>there is pixel garbage at the bottom of the screen.
>
>Yes, then save that screen mode and reboot. It's far better then Videlity.

OK, I did that but my Falcon booted into 640*480, ignoring the res. that I
saved (using centvid3.app).

I agree that its easier to use than Videlity, and I admit that I had to seek a
demo of it, but at least Videlity works!!

About half-way down the opening page - F4 toggles between enter and skip (see the upper right of the help screen for the current state).

>I tried to update the flash with PUTFLASH utility and I also tried

IIRC the first time that you boot with the later version of the flash you have to read through some text before you're allowed to continue.

BTW, does anyone know what the last version of the English flash file is? I have 1.33 installed, but have 1.39 available - that's the latest on Rodolphe's web site, but I have a suspicion that there is a later one from elsewhere. Sacha?

Cheers

I have 1.39 (german) installed, but IIRC I once downloaded a 1.4?
from some CENTEK page but that was only available in french.
There was some information then that there will be at least an
english version be made available but I never read anything about
it since then.
And if the right guy is listening : how about making the source code
available instead of throwing it away ?

Hi Rodolphe !!!

A long time i don't see you ;-) i'm happy that you come here sometimes !

Yes i used eagle as demo version to enter my schematic, origanlly drawing
at hand ! My PCB exist, sure, but too draw at hand...
I tried to draw with Eagle a copy of my PCB but i didn't find the Mini DIN
6 points for PS/2 connectors...

if you have a little of time i can send you the .sch. it could be fine to
get the same PCB as my "version drawed", because i need to keep
the measures for the external case, and the same implantation....

I will try to do a scan of my PCB version....

5892. AUTOBUSK: Now available

Newsgroup: comp.sys.atari.st
Date: 2001-12-13 01:46:52 UTC
From: tconrardy@hotmail.com
Message-ID: <ce22d101.0112121746.1f40fbf7@posting.google.com>
Source record: 39564

Some news

Just found out that Clarence Barlow's program called AUTOBUSK is now
available. It is an algorithmic MIDI system . He has been working on
it ever since 1986! It is available now on the link below. I have also
my first impression about it as well as a short tutorial (that is
without a manual yet!)

==========

http://www.musikwissenschaft.uni-mainz.de/Autobusk/

This is AUTOBUSK 2000, Copyright (c) 1986-2000 by Clarence
Barlow

==========

Autobusk: 1rst impressions

Copied the disc to my Falcons Hard drive and ran
Autobusk.Prg.Came up no
problems, seems to be lots of setup files happening in the
background.

The main screen looks facinating.Looks like it autoloads a file
called
INVENTIO. Instructions in the bottom say to hit RETURN to START
and ESC to
stop. Once you do that, you hear an interesting piece coming
out. Hitting
esc stops it. Then when you hit RETURN again, it says PRMS
(parameters) are
alterable. Then you can go around with the mouse, and first
going into the
box(s) where it says OSTINATO: and clicking it it, you can then
move around
the mouse to the parameter screen above it and change stuff. You
will also
notice that by positioning the "curser" over a parameter, there
is another
feld which reveals it's Hot key! I have found if it says, [Kk]
selecting k
(small) will bring the number DOWN, while Shift K will bring up
the number.
Neat method. You casn also use the hot keys while it is playing
for realtime
control of the parameters.

Things to change are (for example) Pitch center,tonic pitch,
melody
scope,event length,dynamics,attenuation,sound/controller/ midi
channel,eventfulness and others

After you change stuff, hit return and it generates MIDI music
based on what
you have inputed.

That is all I have figured out for now. I am waiting on the
manual, but this
system looks facinating and I am glad it is now available.

Sorry for the extreme delay, Ken. I can't seem to find time to use the computer at home - bt I'm still here!

I boot into MagiC by default, but I use the replacement Shutdown v1.6 which gives the option of re-booting directly into TOS and still chosing a TOS setup from XBoot if I need to.

>> I don't have a problem with using the mouse in XBoot. What might

> Should I disable this and just use NVDI's mouse accelerator?

If you used a mouse accelerator that did something clever then there might be a reason to retain it, but Atari's one is basic in the extreme, so should be dumped in favour of the NVDI one. Atari's one is also very old and may be doing something silly.

That said, neither should make a difference, because XBoot uses its own mouse routines AIUI...

>>> I also cannot seem to assign a program to boot in Xboot.
>>> Seems like I have to wait for the desktop, then go to the program
>>> that I want to use manually. Is there a work around for this?
>> Again, there shouldn't be a problem here.
>> Were you using Magic before? What program did you want to

> No, I was not using MagiC before. Just TOS with HDdriver.
> I would like to autostart LOGIC, FLASHII, ATARIWORKS.

A couple of things may be happening.
I can't remember whether when you boot up in Magic whether it still looks at your old Desktop.inf\Newdesk.inf file.
Also, XBoot has the ability to copy previously stored versions of this inf file and copying it over the one in the root directory. Look in Tools\Parameters in XBoot to see if this is happening. It may be that you're saving an inf file and then immediately copying over it with

XBoot.
Thirdly, the installed application needs to be set in Magx.inf too, so
after you install a new set in XBoot with the autostart application,
you'll probably need to save a new MAGX.INF file in MagxDesk's
Options\Save Options menu entry after you hit the desktop.

Have a look in that general area. Hope it helps...

I think STDCAT was the program you were thinking of.
Here's an extract from my disk library...

The alternative desktop, Neodesk 4, will also do this from a GEM
dropdown menu.

I'm taking it to the printers tomorrow! Now is your last chance to get a copy of The Atari Times 2001 Year End Issue!

This 100-page issue includes the years best from The Atari Times website as well as over 15 pages of new material and articles! Also, a color-cover will be included. You can see for yourself by going to http://www.ataritimes.com/specialfeatures/2001_YearEnd.html

Only 50 copies of this special issue will be printed, so make sure you guarantee yours by preordering by December 14. The preorder price is only $16.95! And don't worry about shipping, it's included in the issue price.

http://www.ataritimes.com/specialfeatures/2001_YearEnd.html

Thanks for supporting The Atari Times!

>Anyone worked with MacMint? How well does it work? Does it run Atari
>software (if used with NAES, AES 4.1, XaAES, or whatever?) or does it only
>run Mint-only software? In otherwords, does it have any use at all? ;)

It runs console based applications. I don't think it has ever been developed
far enough to allow an AES to run. I guess MacMiNT was developed to show
"that it can be done" and to use some of the compilers that run under
MiNT/TOS. Some console based applications need fixes to run with MacMiNT.
So if you're not into this console stuff it's pretty much useless.

5906. [GAME] Nuq v0.2 for Atari available

Newsgroup: comp.sys.atari.st
Date: 2001-12-13 15:08:40 UTC
From: Patrice Mandin <pmandin@fr.mailandnews.com>
Message-ID: <o9gav9.445.ln@127.0.0.1>
Source record: 39575

Hello everybody,

I found why the FPU version was not working: the binary was linked with
the non-FPU libraries, so now it works.

Both version work now. I also added a GEM driver for the video, which is
best suited for multitasking AES.

Goto my website for the download.

Hi Hallvard

What's you want...is what's you get ! I did a little update and now you can find a capture of my original PCB !! I did it this morning, i'm very lucky...Where i work, there are a scanner (i didn't know) :-))

I expect Rodolphe can help me with Eagle, i sent this morning to him the capture to try to get the same PCB and componants positions.

Laurent

5910. [PUB]Eiffel update

Source record: 39578

again a new update http://eiffel.atari.org with a scan of my PCB and componants positions from my white paper...

I know somes people try to contact me to get an interface, but sorry i will be in holidays, and awaiting for somes feed back about the first items...So the best way is to contact me next year...

I will be already online to ask for any questions and help...but not ,while vacancy, to build any Eiffel; my wife will not be very happy ;-)

Thank you

Regards
Laurent

5911. Help needed with MEGAST/Megafile30

Newsgroup: comp.sys.atari.st
Date: 2001-12-13 22:02:25 UTC
From: Christopher Thorley <chris_thorley@lineone.net>
Message-ID: <3c192532$1_3@mk-nntp-1.news.uk.worldonline.com>
Source record: 39577

Hi everyone,
I am desperately in need of help. I am trying to set up
my MEGAST4 and Megafile30 hard disk for the kids. The MEGA4 appears to be
working fine. However the Megafile would appear to have a problem. I
formatted the disk using AHDI 6.06 and stayed with the partition scheme it
generated (4 partitions of about 7.8MB).

Now, if I copy programs to the hard disk and try to run them it keeps coming
up with an error message (TOS error #35). I can read text files alright but
programs just don't run.

Any suggestions?

Thanks.

Chris Thorley.

There was once talk about a fVDI-driver for MacMiNT. I have no idea if
this works or not, but when/if it does, N.AES or XaAES should (in theory)
work.

5915. acc/auto/newdesk selector?

Newsgroup: comp.sys.atari.st
Date: 2001-12-14 09:54:40 UTC
From: alex.stepney@bluewave.com
Message-ID: <e344ade0.0112140154.14ea82ae@posting.google.com>
Source record: 39587

Hi,

can anyone recommend a good acc/auto/newdesk selector? I need to differentiate between my Cubase and other sessions. If its shareware can I still get hold of the author to pay them?

Many thanks,

Alex.

5916. FS (soon) Falcon - UK

Newsgroup: comp.sys.atari.st
Date: 2001-12-14 10:06:02 UTC

Message-ID: <3c19cf0a$0$176@news.zetnet.co.uk>
Source record: 39588

Hi All,

Just an advance notice that I have been asked to sell a Falcon on behalf of one of my pupils.

I can't give you full details yet, but it is no-frills (i.e. no add-ons) machine believed to be in good order. Comes with one of the flatter screen monitors (14inch I think) that System Solutions supplied for a while, and a copy of Cubase (not audio) with key and manuals. (I think it's version 3.0)

I don't think there is any other software with it.

I'm not sure of the price yet, but some offers would help me get an idea what it's worth.

I'm hoping to collect the machine in a day or two and I'll see what else I can tell you. I'm in the Peterborough area (in the UK), but I could possibly arrange shipping of the computer (preferably not the monitor) if anyone abroad was interested, but remember it has got a 240volt power supply.

Anyone interested mail me direct please: paulw@zetnet.co.uk

Cheers

Paul

Well, ther is GNU C which is freeware but the manual is quite complicated
(well being a newbie myself I thought so). Try Lattice C which is
commercial but I picked it up second hand for about ï¿½30

Date: Tue, 11 Dec 2001 00:06:50 GMT

Hi Michael,

>If what you said about the Deese card being able to run Cubase Audio is
>true, then I agree with you 100%! I'd love to have a Falcon-compatible clone
>like this! Thanks for the info! I hope it's true!

Hohoho.... hold the horses!!
I didn't say that the Deese card is able to run it, I said that from what has
been stated in the past about this card, I've got the impression that it will
run. But a lot will depend on how good the driver is and if that card will
make it ofcourse, just like the other stuff discussed here, it *is* still
vapourware. If it's produced and if the drivers are as good as promised and
if by that time there are still Milans available, there are a lot of "if's"
connected to this story, too many for my likings...

>>And for MiNT users MagiCMac isn't a solution at all... it's their worst
>>nightmare ;-)
>
>Anyone worked with MacMint? How well does it work? Does it run Atari
>software (if used with NAES, AES 4.1, XaAES, or whatever?) or does it only
>run Mint-only software? In otherwords, does it have any use at all? ;)

It runs, but in practice it's unusuable.
The positive point to remember is that MacMiNT shows that it's possible to
port MiNT to a Mac environment.

>> As for your wife, you could explain her in a very calm but decisive manner
>> that there are more women then Atari computers on this planet <grin>
>
>I could, but I wouldn't. Guess that shows where my real priorities are then,
>huh? What kind of Atarian am I?!?!?! :)

Ofcourse you wouldn't....
But once she knows, she'll look at your Atari gear in a different way, believe
me... I know :-)

Cheers from Belgium
Dennis

>some with 3. All the programs thay don't run from hard disk run from floppy.

If you copy a program back to floppy from the hard drive does it then work?
If not, then it would seem to indicate a problem with the drive -
termination and so on.

Hello.

Re Cubase and Yamaha CBX-D5.

We all want to know....(?) what do you mean by ' supports '?

The box is very useful with a Falcon and Cubase Audio but for straight sequencing I presume it just works.

Please be a little more specific.

I have both Cubase 3 and Audio in stock.

I'm afraid the coders of Gemspooler are no longer using the Atari full time. Steven has, AFAIK, switched completely to windows, and Marc is currently using Linux.

But if you have questions, you can always ask them (I don't regularly read this newsgroup, so a mail to marc.billiet@bigfoot.com might be quicker).

Marc

Andy,

What type of Atari do you have. How much memory does it have? Do you have a
hard drive?
If you have only a basic system then I recomend that you get either a second
floppy or a hard drive.

For an "Original" ST, STFM or STE with no hard dive Sozobon is quite good,
but there are some bugs in it,.
I think these are in Multi Dimensional arrays so they don't affect most
programs.

If you have a Hard Drive GNU may be better, but it won't work on a floppy.

You will also need an editor, and possibly a shell/CLI.

If you want to write GEM (i.e. GUI programs) you may also want a resource
editor...

I spent many a happy hour coding away using a twin-floppy system using Gulam
as the CLI/EDITOR and
SOZOBON as the "C" compiler. But I must say when I switced to a hard drive
productivity went up nearly 10 fold
when I got a hard drive...

Dave.

>There was once talk about a fVDI-driver for MacMiNT. I have no idea if

I did indeed do some work on that a couple of years ago. Since I didn't
have a Mac to test on at the time, I stopped, however.

Nowadays I do have a few Macs (PPC601/68040/68030/68000), so I might be
persuaded to do something about it if there is a genuine interest.

>this works or not, but when/if it does, N.AES or XaAES should (in theory)
>work.

Getting those to display some graphics shouldn't be very hard, really.
I imagine the mouse handling would be a bigger problem, but certainly
doable.

I tried it hopeing there was a RSC file but there wasn't :(
Also, it hit me with what look liked my FAT table shwn on the screen so I
quickly quit!

I noticed that www.emmesoft.com seems to have one for sale. It's a
STacy 4/20. It's rather expensive, but then again, it's a rare item.

Hope that helps,
Andy Blakely

A4 paper is 210 x 297 millimetres.

Using an imperial inch of 25.4 millimetres, then that translates to
8.26 x 11.69 inches.

(Dunno what an American inch is, so cannot translate)

I have 2 Atari systems.
1 - STF w/1mb, TOS 1.4, 2 floppy drives
1 - STE w/4mb, TOS 1.6, 540mb SCSI HDD setup (using ICD adapter),
Mario Becroft's VGA adapter.

I would love to have GNU C, but I can't find where to download it!
Can somebody please tell me? I also have Laser C with the book and
everything, but one of the disks went bad!! If anyone else owns Laser
C, I'd love to get a copy of that one disk from you.

Thanks guys - Atari users are like a family

Hi all!

The HomePage Penguin 3.05 (08.12.2001) is now available from my new webshop.
The shop also offers payment via paypal.
Other products:
NewSDK - a CD-ROM packed with Atari development kits, tools and
documentation.
SIDmania - SID music, SID emulators and a lot of goodies!
... and more

URL: http://www.mypenguin.de/shop/

BTW, users of old HPP versions (prior to 3.x) should contact me if they wish
to upgrade their HPP.

Hi Ken!

A4 is actually officially, 210 x 297 mm which is 8.27 x 11.7 inches.
US Letter is I understand 8.5 x 11.0 inches or 215.9 x 279.4 mm,
so is some 6 mm or a quarter inch wider and 17.6 mm or 0.7 inches
shorter than A4. Of course the printer can't usually cover all of
the sheet in either case. The width difference should be
unimportant but the different lengths will affect the layout if
the printing program does not send FFs but goes by the length of
the paper.

Regards, /Peter/

Width could be a problem depending on the margins chosen by the author of the document.

>>But it can be done in other ways, and it printed.

Possibly the simplest way to print an (Atari-originated) PCL (HP) or ESC P
(Epson) print file from a Windows-loaded machine may be to do it from a
command line prompt:

> COPY filename.ext LPT1: /B

the /B option being very important, because it tells the operating system
to send the file in "pass all" (i.e. binary) mode. I have thus printed many
print-files from DynaCADD, Megapaint and other Atari applications, without
any problem at all.

Btw. printing those files on PCs at work often aroused questions from nearby
personell- which Windows application was used to make so nicely-looking and
accurately dimensioned sketches with rasters, different line widths, etc :)

Cu;

Well, I would like to have a lot of people test nuq with and without FPU
to see if any problems arise, specially if you have a non standard Atari.
Please provide all necessary informations: machine, OS, _VDO cookie,
etc...

There is also a test benchmark described in the Changelog file, to
compare speed between machines, so I would like to have some reports
about it also.

Thanks, it may help build a better version.

Hello all!

We are pleased to announce the HighWire Development Project web site.

URL: http://highwire.atari-users.net

While NO DOWNLOADS are available at this time. There are some screen shots and other info available for those interested. Downloads will be available shortly. This is a chance for non programmers to get an idea of how development is progressing and to book mark the site before the initial release announcements are made.

HighWire is a New Atari Browser that is UNDER development. We are asking anyone interested in helping code HighWire, in C, to join the group. We are also looking for people experienced in translation and documentation, so that the project can be available to as many Atari users as possible. Without any hurdles due to language problems or documentation.

Please visit the developer section of the site for information on how to join the list.

HighWire Development Project

Why take a taxi... When you can fly!

If you're trying to run games, you should be aware that a *LOT* of
games on floppy disks contain "copy protection" and will only run
from floppies. Even if you successfully copy all the files on the
floppies to the hard drive, the programs will crash.

On the other hand, word processors, spreadsheet programs, DTP programs,
etc., should run flawlessly. If you are having problems running these
problems from a hard drive, then you really do have a problem.

Hope this helps,

Randy Kwak
bm827@ncf.ca

5961. Papyrus, ArtWorx & *.gem

Newsgroup: comp.sys.atari.st
Date: 2001-12-17 17:08:46 UTC
From: gregory@NOSPAM.atari.pl
Message-ID: <9vl8qt$t3$1@news.tpi.pl>
Source record: 39533

Hi,
I have big problems importing *.gem vector graphic created
in Artworx into Papyrus. Everything seems to work fine, but
the imported graphic is always black&white, all the color
informaton is lost. I have tried exporting graphics from
Artworx as "GEM Meta-File" and "GEM Meta alt", but none of
them worked correctly with Papyrus. However, I could open
them again in colors using ArtWorx. The same thing happens
with *.gem files generated by GEM-Graph - all the color
information is lost.

Is it a bug in Papyrus, a bug in Artworx or am I doing
something wrong? Are there any other vector formats that
Papyrus can handle?

5962. Grandad 1 Quest for Holey Vest code? Atari ST

Newsgroup: comp.sys.atari.st
Date: 2001-12-17 17:12:11 UTC
From: Satcom2 <svenhard@mindspring.com>
Message-ID: <9vl9ql$fg5$1@slb6.atl.mindspring.net>
Source record: 39534
Cross-posted to: comp.sys.atari.st,maus.computer.atari.software,maus.sys.atari.software

Every year or so I seem to get this urge to play Grandad 1:Quest for the Holey Vest on my ST which I never got all the way through, and every year or so I remember that I lost the 6 digit code that I ordered from the author about 6 years ago. The author has long since changed his e-mail and I have never been able to contact him, including sending a letter all the way to the UK last year. (Ian somethingorother was his name) Grandad 2 had a very complex protection code printed on a dark red piece of paper, but Grandad 1 just had this wimpy 6 digit code, same for everybody, all I had to do was write it down, which I never did for whatever reason. If anyone could e-mail me the code I would appreciate it, obviously if I went through the trouble to get the protection sheet for part 2 you can trust me that I registered the first one. Plus how did I know it was a 6 digit code? Thanks for any help you can give me. -Satcom2

Why is it dangerous to combine Edge and HDdriver? IMHO this makes no sence at all. As long as one doesn't make use of long file names Edge is a very safe product. Edge is much easier to use then Discus -I don't have it about the language here but about user friendlyness-
Also to be clear I don't say Discus is not good or whatever, it's only harder to use.

The version of Papyrus I own is probably the most buggy, untested, unfinished useless piece of crap I've ever bought, I will not spend anymore money with ROM.

>
>Width could be a problem depending on the margins chosen by the author
>of the document.

Yes I agree, but unlikely. Since the printer can't cover right out
to the edges of US Letter anyway in most cases (except for A3
printers), an eighth of an inch each side is unlikely to matter
unless the user is extraordinarily fussy about layouts... Even on
an A4 you could probably tell the printer you are using US Letter
or even A3 and adjust the margins to give the exact required
printed area.

Well, on my NON FPU Falcon with a Phantom accelerator it was very slow!
Unplayable, but I do not blame you, Quake on a PC needs a DX CPU with the
FPU so I beleive that an FPU will help Quake run a lot better!

>anyone else (who'd usually charge a lot for what little they give
>back)!!!

I agree, and since the knife cuts both ways it would also be beneficial for
the Atari community to support Diskus rather then an outdated program like
The Edge.
If anyone who is remotely interested in an English version of Diskus would
come forward and let Dr. Uwe Seimet know it then if demand is high enough to
warrant the work and effort involved, it might just happen...
Translating Diskus at source level wouldn't be an enormous task, the manual
however is another story... but then there's always DDP ofcourse to come to
the rescue ;-)

Cheers from Belgium
Dennis

| Are these just demos, or have they been released as freeware as many now
| unsupported software packages have been for our platform?

Coma is an excellent fax program. I never tried the Answering machine, &
Voice-
On-Demand-System. There was an address in England (for UK users only I
presume) that
you sent money to to get a code to register the program.

The demo did work as far as I recall but there must have been some limitation.

Thanks for the suggestion. I also tried that with the files when I first got them (after seeing this solution on the Microsoft web site). However, it didn't work - most likely because I was attempting to print to an Epson printer. All I got were garbage characters.

However, I got everything worked out with a couple of demo programs that dealt with PCL files, so all is well.

They surely work but with shareware restrictions. Coma is the best fax
program available for the Atari. It's surely worth the money.

>You did it blindly?

What I did was mainly to try to get rid of Atari specific things in fVDI
and to start looking into how to get at the screen on a Mac.
I stopped before there was anything that could be tested in any way,
mainly (as I said) because I would have no way of doing that.

'Blind' developing/debugging has happened a few times later, though,
when people with Eclipse cards have had problems I've not been able
to duplicate on my system, for example. My recent attempts to make
the RageII driver work on the Milan have been like that too.
Needless to say, this way of doing things is of course a whole lot
slower than when you have the actual hardware available.

>: Nowadays I do have a few Macs (PPC601/68040/68030/68000), so I might be
>: persuaded to do something about it if there is a genuine interest.
>
>Trust me, that would indeed be interesting. Macs with nice specs are much

Since there seems to be a few people who are interested, I'll keep it
in mind. Can't promise anything any time soon, though.

If anyone else wants to give it a try, I'd be happy to help out.
Besides the current monochrome driver and my 16 bit example driver,
there's now also the ARAnyM driver to look at, so getting the graphics
working really should not be a major problem.

>easier (cheaper =) to get at than simiarly specced Ataris.

You don't say...
I'd be happy to get a single (unaccelerated) Falcon for the price I've
paid for all my Macs together.

It was indeed because you were printing to an Epson printer. Once I "relearned" that copy command (I've forgotten a huge amount of my DOS knowledge.) it printed fine on my Laserjet, not counting the paper size problem.

IIRC it's not just the chip number that's the issue. AIUI it's the
tolerance of the spec that was the problem as well.

If the serial number of the STe itself ended with a number from 20000
onwards then the DMA was ok even though it was marked with the same
C025913-38 number as it was originally.

Plus, of course, any STe which was originally fitted with a TOS 1.62
was definitely ok.

> I don't know where you can buy a new (working) chip these days, but
> perhaps someone here can help. Or ask the few remaining Atari
> dealers around.

Atari Workshop or Brad at Best seem the most obvious sources - though
Barrie at Keychange may be able to do something.

> Other than that it might be easier (and cheaper) to buy another STe
> as lots of people who have moved on to other platforms think our

Probably true and easiest...

> However, there's no way of knowing if the machine has a faulty or OK
> DMA chip without actually opening up the machine and visually
> checking the number on the chip.

For the reason stated above, this isn't necessarily the case.
As evidence, my own STe was checked out and the DMA was replaced by
Atari UK in Slough England and came back with a chip of exactly the
same number. It ran with an 80Mb Quantum through an AdSCSI connection
for several years after with no problems.

There will definitely no English version. Creating and maintaining this
version and translating the manual and other texts would take a huge
effort. As far as translating DISKUS is concerned System Solutions
thought briefly
of it about two years ago. The same was the case for a company in France
some time ago. But both companies realised that it would take a huge
effort
to do so (and they are right) and so they decided not to do it.

IMO it is unlikely that somebody else can maintain (or even add
extensions
to) software like this. There are hardly any programmers left and even
less
that have a sufficient knowledge for such a job.
We have seen that usually this doesn't work with almost any software
package
for the Atari, that has been discontinued and was released to the
community
with the complete sources: Even if you do not have to pay anything for
the
sources nobody is usually capable of maintaining them.

I would be interested for up to 15 UKP - not more as I find
HPOptimizer fine for defragging. Even then it would have to work
with LFNs and also very large partitions (it doesn't with the
current version, returning nonsensical, negative sizes).

Can't help with development as I am not a programmer.

Sad News:

ATARI NOTES IS GONE!!

Atari-Notes has been a part of Sound On Sound Magizine (UK) for
a good long
time and Derek Johnson has supported and reviewed Atari-MIDI
stuff to our
benifit and also kept the light that there was STILL a strong
Atari presence
in the world.

Now it is up to US to keep it that way!!

I am going to need ALL of your HELP here.
First, I am forwarding our corresponance. See below.

Also, I see this not for only Atari , but for all those who have
alternitive
computers. Its a principle. Lets get Atari Notes BACK!!!

Lets keep this CIVIL but to the point.Please send an email to the
Publisher and if you want, to the Editorial Director. Express you
would like to see Atari Notes Back.

There is also an on-line Atari forum where you can express yourself
about this issue as well.

Email Address:

Publisher Ian Gilby publisher@sospubs.co.uk
Editorial Director Dave Lockwood dave@sospubs.co.uk

see my Atari Notes Page:

http://tamw.atari-users.net/atarinote.htm

> Andy Blakely, USA

Latest versions of GNU C can be found in SpareMiNT archives:
sparemint.atari.org, but they are RPM packages and will need lots of memory
(more then 4MB). Older versions of GNU C can be found at various FTP servers.

As for version 3.x they are reported to work to sloow and require to much
memory to run on ordinary Ataris.

You will also need MINTLIB which is a LIBC implementation for Atari. It can
be found in same places as GNU C. There is some problems here: you need
newer GNU C versions to use newer MINTLIB versions, if you will use old
compiler ypu have to use older library.

There are also some other free C implementations on various FTPs but I
wouldnt recomend that becouse they are old.

6008. WTD Graphics card and CLAB MkX case

Newsgroup: comp.sys.atari.st
Date: 2001-12-20 14:25:14 UTC
From: purpletwilight3000@yahoo.co.uk
Message-ID: <2bfabd3.0112200625.678e0479@posting.google.com>
Source record: 39429

Looking for a graphics card (anything considered)
and a CLAB Mk-X case (remember those) for a Falcon
setup that needs rescuing and recasing.

email purpletwilight3000@yahoo.co.uk

Cheers

Bob

And that's not lines as in number of /text/ lines, but rather scan lines.
About an inch and a half high fax if my maths isn't too far wrong!

According to the history headers of the UDO source files, preparation of the English file structure began mid-way through November 2000. Therefore, the translation itself took a year, plus whatever time Ulf needed to compile the html from the results.

Thanks for the kind words - this and the hypertext, bubblegem and resource file translation for PhotoTip have kept DDP Translations very, very busy this last year.

6011. FSEL_INPUT problem

Newsgroup: comp.sys.atari.st
Date: 2001-12-20 15:26:47 UTC
From: g.goebertus@chello.nl
Message-ID: <3c22023e.22726108@news.ams.chello.nl>
Source record: 39430

Hi all,

I'm having problems with the FSEL_INPUT routine in GFA basic, but ONLY
on a Falcon (4MB, no harddisk, just a floppy drive).
The routine works exactly one time as it should, after that the
fileselector completely disappears when I click on an item or a
button...
Is this a known problem, and if so, is there a patch?

Thanks,

Guido

Hi Chris,

>I keep reading here about the CT60. I don't believe I'm familiar with
>it - can anyone enlighten me?

Super booster from the guy who bought you the CT2. Falcon only with a
possible PCI bus adaptor. Check out this link: http://www.czuba-tech.com

>Is it available in the UK? How much? Is it plug and go, or does it
>require soldering (eek)? How compatible is it?

Isn't available yet!! He has produced hardware prototype and still
working on software I think. Prices on his website. Should be quite
compatible on games/demos and very compatible on GEM apps. No soldering
needed! Slot in the Falcon bus port. Needs PC ATX powersupply for the
3.3v supply.

>Just getting fed up of waiting for Tempest. I'm even thinking of
>buying a PC...

Hmm, I think you need to see a doctor ;)

Well the message to you from the Overscan documentation was :

Unfortuneally the best two graphics programms, CAD3D from TOM HUDSON
and CYBERPAINT from JIM KENT don`t work at this moment with this higher
resolution.

TOM and JIM are YOU jet listening to this ???
Please try to adapt Your superb programs !!!

I think people really like your programs even though I've never tried
them. Wow, haven't been on Atari since 1989 and you return?! That must
be some kind of a record, so what programs did you do on the PC?

That is correct.

>Does anybody know where I can obtain this chip? I only need one, but would
>order in bulk if required to get some for spares.

Well, I have a couple of STEs which I could desolder the floppy controller
off as they both have problems, obviously not realted to floppy. Email me
if you want. You could also try http://www.best-electronics-ca.com/custom-
i.htm.

The WD1772 is used in STs. In the Falcon and TT they had a chip that is
comptible to the WD except it can handle 16Mhz or even 32Mhz for HD an ED
support.

Hi

I'd like to buy an assembler with English Manual off someone, prefer the UK to avoid huge P&P. I'm thinking something like Turbo Assembler or Devpac, not sure really. If it can compile 68000 code I think thats all I need.

Also, I have "GEM Programmers Reference" book by Abacus software (pretty commen book) and when I bought it I didn't recieve the disk with it. Didn't realise at the time it came with software. Does any one have a copy of the disk they could send me please? If you don't believe I have the book I'll show you a scan of the front cover, or any page if you want!!

Thankyou,

I think there is a option like this in HDDriver but looking at it, if
there is no FAT, how can you tell what clusters belong to which files? It
would just look like a huge string of bytes!! There are two FATs, IIRC
the second is a complete copy of the first. Perhaps that helps?

6029. Strange CAB panel

Newsgroup: comp.sys.atari.st
Date: 2001-12-20 22:01:22 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <9vtn3i$50u$1@thorium.cix.co.uk>
Source record: 39436

For some time I have noticed oblong panels marked 'Censored' with a large question mark below the text appearing in various HTM documents in my CAB 2.7 (I think the first I saw was in an old 'My Atari' page). I thought nothing of it, figuring it was some kind of ad that would eventually reveal itself.

Recently an acquaintance sent me a printout of a page downloaded on her PC which had an advertising panel for some sort of detective agency along the bottom. But when I accessed the same page, I got the 'Censored' panel again. It would seem that *something* is intercepting ads on HTML pages in my CAB. Not that I object, mind you (far from it) but I would like to know what is causing this. Any ideas anyone?

Regards, /Peter/

6030. Interest check: Mega ST 4, Megafile 30, kb, mouse, Atari modem, no monitor

I may be able to acquire the items in the title of this post. They won't cost me anything, but getting them will require a bit of work (well-timed dumpster diving, as they're being thrown out but have not yet been through property control). Is there sufficient interest in this to justify my getting them and shipping them out?

As mentioned, there is NO MONITOR. As a result, it's a little difficult to test whether it works (though I can at least check that the power comes on). I'm not an ST aficionado, so I don't know anything about the machine (although I'll be happy to provide you any label information, etc.).

Obviously, the price level at which it becomes worth my time to do something decreases dramatically if I don't have to ship anything. If you're interested in picking it up personally, I'm in Jackson, Mississippi.

> I've contacted the author about this and the fact that only a German
> version is available there, but since my Notator mailing list members
> might need a RSC editor (for organizing some new MIDI/sound icons I'll
> be making available one of these days), this program would come in handy
> for sure! But... preferrably an English version.

I also bought Interface 2.30 years ago. I downloaded the "free" version some months ago and used... Interface 2.30 to compare the French (old) rsc file and the German (new) one. There is no difference, except in the info dialog but it's not a problem. You will notice that the later version still shows 2.30 as the version number.

Btw, this comparison tool is the kind of thing that I really miss in RSM.

That sounds strange. You should not be having that problem as far as I know
as I also use GFA. It is hard to tell what may be the cause without seeing
the code you are using. In my own GFA programs I don't use the built in
FSEL command, I find I have more control with a custom binding.

Also there is GFA Mailing list with 11 members thus far, you can find more
info about that at my site listed below.

Source record: 39442

Hi,

What is RSDAEMON.PRG used for in CAB?
(v2.7)

Does this conflict with WBDAEMON in MAGIC?
(v6.01)

Is WBDAEMON safe to use with HDdriver?

Why does CAB seem to download into CACHE every site I go to?
Is this normal, or do I have something improperly set?

When I type certain characters, they are not represented like my
keyboard. For example, the ~ is in a different place.
I think it is a British keyboard. Is it possible to get an English
keyboard?

Thank you in advance.

I don't think that it is a GFA problem since it sounds similar to the
problem I have in PurePascal on my Falcon. When I succeed in clicking
on one of the invisible items or buttons part of the fileselector box
reappears again and stays at any further input until closing.

Hi Hallvard

On 20 Dec 2001 08:41:52 , Hallvard Tangeraas wrote rather a long missive ,most of which I have snipped.

>I'm working on an icon collection mainly for people using their machines for MIDI/audio. snip..snip..

>So, for everybody else who upgraded to TOS 2.06 -did you get some sort >of documentation with it? Anywhere I can download anything like this, or >could you send them to me (ask me first *before* sending any >attachements)?

My upgrade was done with a switchable TOS at the same time as a memory upgrade and conversion to High Density floppy. This was all done by TUS (The Upgrade Shop) who have moved on.BUT I do know that many of their ex customers have moved over to KEY CHANGE who used to work with TUS.They are carrying out repairs etc as did TUS. A word to them may help. Barry I know reads this group (As does Dave (TUS))so you may hear from them.

Somewhere I have the TOS 2.06 Manual (ATARI Corp UK) around as well as 2 disks that TUS sent me,one with 2.06 itself and one with CPX`s etc. I`ll have a search for them over the weekend and get back to you.

Regards and Seasons Greetings to you and yours and to all Atarians wherever you may be.

>What is RSDAEMON.PRG used for in CAB?
>(v2.7)

It's actually part of IConnect I believe - a bit of the stack software
needed for your internet connection.

>Does this conflict with WBDAEMON in MAGIC?
>(v6.01)

Nope, two entirely different applications/uses - that's a write-back cache
program for your hard disk I believe.

>Why does CAB seem to download into CACHE every site I go to?
>Is this normal, or do I have something improperly set?

CAB downloads into a cache (you've set that up in the config somewhere).

>When I type certain characters, they are not represented like my
>keyboard. For example, the ~ is in a different place.

Mis-matched operating system language, NVRAM or keyboard.

You can remap the keyboard with a utility if necessary.

Have you tried using wind_update() to lock the screen before calling the
fileselector? Perhaps not the best solution or legal, but if it works you
could do this only for the TOS version that gives you problems.

6050. Laser printers for use with Atari/NVDI

Newsgroup: comp.sys.atari.st
Date: 2001-12-21 16:30:05 UTC
From: publish@welshnet.co.uk
Message-ID: <3c236348.16583019@news.cis.dfn.de>
Source record: 39454

My HP Laserjet 4 is giving up the ghost and although I have a spare to cannibalise I doubt if I can rectify the problems economically. Therefore, does anyone have a list of laser printers than NVDI (v4) will support. I need 600 dpi output, and because I tend to use a lot of graphics I would need 2MB of onboard memory has a minimum and of course a parallel port!

Any info appreciated.

And if I upgraded to NVDI 5 would that help matters?

Cheers

Best wishes
Mike Kerslake

I use a LaserJet 5L with NVDI 5, you can cut yourself on the character edges, uses a Toner/Drum system, but I've never had to replace it yet. I bought it following a magazine article that worked out running costs on a pages per refill basis against a Inkjet, its paid for itself a number of times over IMO.

Damn useful that article, good things those magazine doo-hickies, although you get some right weirdoes running and writing them!!.. 8-)

Hi Ken!

KK>Why does CAB seem to download into CACHE every site I go to?

Originally, CAB was merely an offline reader for HTML. Online capability was added later by introducing the cab.ovl called programme, which does all the http file handling over the net and stores these files in the cache, from where CAB then can display them.

Message-ID: <CzMU7.95972$8w3.19483353@typhoon.kc.rr.com>
Source record: 39462

I have been trying to get my old Mega 4 ST up and running again (it's been in the attic for years) and have run into a roadblock.

I have two Supra hard drives, a 20- and a 30-MB unit. They are ganged together with one of Supra's interface boards. They are split up into logical drives C, D, E and F. Everything boots OK, and I have a copy of the old A-RAM ramdisk in my startup sequence, which loads and initializes, and says it's drive G. This tells me that the other logical drives have initialized OK.

The only remaining problem is that something has happened to my desktop info and NO DRIVE ICONS appear at all. I can't remember how to get the drive icons back in this situation. Can anybody refresh my memory on this? Thanks!

Hmmm. No, my system doesn't have that option. I have GEM/TOS dated
1986/1987, and the Options menu has:

Install Disk Drive (grayed out)
Install Application (grayed out)

Set Preferences
Save Desktop
Print Screen

What's really weird is that not even the floppy icons are showing up.
Without them, I can't get the "Install Disk Drive" menu item to enable
itself, because you have to have one of them selected to do that.

I opened the system and re-seated the ROMs, but still no joy. What's really
weird is that occasionally on bootup, with the HDs powered off, the system
will boot with no floppy icons. Sometimes it'll have the icons but if I
open the A drive, the filenames are garbage characters. I suspect this may
be a sick computer...

If anyone has any suggestions for getting my drive icons back, I'd love to
hear them.

Source record: 39468

Nailed it. Here's what I think happened...

The first time I booted up the system, it actually came up with the HD's logical drives available, but it was only showing drives A, B and G (the RAMdisk). I used the "Install Disk Drive" selection to set the HD logical drives (C, D, E, F). Stupidly forgetting the infamous 40-folder limit, I opened each HD to verify that they were reading OK. I then did a "Save Desktop".

My guess is that I easily exceeded the 40-folder limit, and when I saved the desktop, the file was corrupted, causing the ensuing grief.

I fixed the problem by disconnecting the first HD, booted with the second one, pulled the Supra boot software off it onto a floppy, powered off, reconnected the first HD, booted with the CTRL-ALT-SHIFT option to suppress HD booting (which I had forgotten about until reading the info that was luckily sitting in the SUPRA folder on the second HD), ran the Supra booter off the floppy, then re-setup my desktop and saved it to the HD. WHEW. All is working now.

As for what was causing the odd floppy read errors I was seeing, I have no idea, but they seem to have gone away, so I'm not asking any questions.

Thanks.
-Tom

You can expect odd behaviour if you have unpowered drives plugged into the ACSI port, so your report of garbled filenames is correct.

Glad you've got it all working again! :-)

6067. CAB truncation problem?

Newsgroup: comp.sys.atari.st
Date: 2001-12-22 16:33:26 UTC
From: osian@underwearzetnet.co.uk
Message-ID: <3c24b5d6$0$177@news.zetnet.co.uk>
Source record: 39472

Can't quite put my finger on it, but I've come across a strange problem on a couple of sites. Try http://talk.rideas.co.uk, mess about with the selection options at the top of the page and the How Far Back option, and see if you can get a page with more than 46608 bytes downloaded! (Tip: Switch off images before visiting)

I'm using the latest CAB.OVL downloaded a couple of weeks ago. Maybe that's the problem as I can't remember seeing this symptom before. Viewing the source for the page shows that the HTML just stops with no proper 'ending', as though it has been truncated.

The RTF export is *far* from being perfect (problems with tables, certain graphic elements, page numbering, footer justification etc.) but indeed, Papyrus is good. Would be better if it could load colorful vector graphics, though ;-)

True. I used NEWSie before, and now I use aFTP. But with both I could
perfectly connect to chapelie.rma.ac.be (you're right, without ftp. in
front of it). I think NEWSie is OK when using single TOS. AFAIK aFTP needs
MiNT or MagiC, but I could be wrong. I always use aFTP with MiNTnet these
days.

CS>Try http://talk.rideas.co.uk, mess about with the selection options at
CS>the top of the page and the How Far Back option, and see if you can
CS>get a page with more than 46608 bytes downloaded!

No problem at all. 14 days back gave me a download of around 1MB, which showed
okay even with images enabled. Well, it took while to format the page, even on
this CT2A Falcon...
The stack in use is MagiCNet, Cab is version 2.8 and the OVL 1.4400.

The URL is quite long, and adding it to the hotlist was a bad idea: error =
-1001, unable to write the hotlist file.

Arch, I see the problem now. You use ftp.chapelie.rma.ac.be as address
which is ofcourse faulty. The right address is 'chapelie.rma.ac.be'
Although it's better you don't need to fill in the path. Without the
exact path you can get in.
>
> I use NEWSIE 0.961.

Newsie is as ftp-client a piece of crap. You'd better use aftp.

The MiNT version of aFTP is the best free ftp-client one can get.
Since you use MiNT-net you may try out ncftp and wget. I love these
apps. With wget you can download whole servers (ftp and http) with just
one command.
ncftp can be found on the chapelie in mint/net
wget (as rpm) can be found on the SpareMiNT pages.

Every program is unfinished and holds bugs. All by all Papyrus isn't
that bad. I know lots of people who use Papyrus daily without any major
problem.

The only piece of crap I know is indeed Adamas. Never got that thing
working for longer then 5 minutes. It goes bananas as soon as it
encounters a javascript, even a very basic one.

I don't know what your problem is but on my system I can use Popwatch
with retrieve path on an ext2fs. Popwatch itself is on a NEWFATFS (MiNT)
partition.

I found the problem. I had set U:\g\pathtomaildirectory. It looks like
Popwatch doesn't like that u(nified): drive. With a direct g:\ path the
problem disappeared.

Apparently it can handle certain simple javascripts, at least
document.write, prompt() and if... work correctly. But the point
is that it is so grotesquely unstable (with or without JS) that
I really cannot understand what did those 40 betatesters mentioned
in the manual were doing...?

Hi Gregory,

>I have tried exporting graphics from Artworx as "GEM Meta-File" and "GEM
>Meta alt", but none of them worked correctly with Papyrus. However, I
>could open them again in colors using ArtWorx. The same thing happens
>with *.gem files generated by GEM-Graph - all the color information is
>lost.

Papyrus can only handle GEM and a weird incarnation of GEM/2 which wasn't
popular at all, the latter can handle up to 16 colours. Applications like
Artworx and Gemgraph export in the approved standard GEM/3 format which
Papyrus for some reason only known by ROM can't handle. The "GEM Meta alt"
export function in Artworx is ment for monochrome graphics only.

>Is it a bug in Papyrus, a bug in Artworx or am I doing something wrong?
>Are there any other vector formats that Papyrus can handle?

It's not a bug, and you're not doing anything wrong either, it's simply a
missing feature. The current version of Papyrus can only handle the two
mentioned GEM formats...
Papyrus supports a lot of bitmap graphics, but vector format support is a
far cry, one would at least expect it to support CVG and HPGL, considering
it's a PC conversion WMP wouldn't be a luxury either. Let's hope that the
soon to be released version 9.0 will fix this situation.

Cheers from Belgium
Dennis

Hello,

I am on the development team, but I am just doing the documentation and offering my ideas as to what the program should have. I just wish I could do more. The programmers are really serious about this piece of software. Things are starting to come together, but there is a way to go. People have to be patient.

This is something I never experienced back when I was using the ST
routinely, I guess I never powered it up without the HDs running. Scared me
a bit when it happened, I thought maybe the system had been sitting in the
attic too long and some component had gone bad. I saw a similar report over
in the st.tech newsgroup, where someone was trying to get a flaky HD going,
so once I had mine running and the floppy problem went away, I assumed this
was the same thing.

> Glad you've got it all working again! :-)

Me too. Kind of makes me wish I had a TT here as well so I could update
some of my old software to take advantage of its better graphics
capability -- I noticed that some people are still using Cyber Sculpt, which
only runs in the ST resolutions. Probably wouldn't be a big deal to get it
running in the higher resolution modes, if people are interested.

6092. Anodyne Software's Roger Burrows

Newsgroup: comp.sys.atari.st
Date: 2001-12-23 15:58:10 UTC
From: ebaiz@skyenet.net
Message-ID: <manV7.53$iP6.50211@newsfeed.slurp.net>
Source record: 39350

Hello all, I would like to talk about something I received from Anodyne Software and that is SUPPORT. Roger Burrows, who owns and runs Anodyne, is one of the nicest Atari retailers I have known since I became an Atarian. Anodyne is the maker of excellent programs like Extendos (CD Rom driver for Atari computers), CD Backup (used to backup an Atari hard drive to a CD), CDISO (like CD Backup only now the resulting CD can be read on any computer CD Rom drive) and CD Writer (audio CD burner program for Atari computers). I recently bought an internal SCSI Sony CD Rom drive (10x CD-R write, 4x CD-RW write, 32x CD-Rom read). I bought it off of Ebay for $150. I already have a Yamaha CDRW drive, but I wanted another in my system to do things like CD Burning and copying other CD discs I had. I usually transferred all the data to a partition on my hard drive. This will make it alot easier. Of course it never hurts to have a spare. A problem came when I installed it in my Hades. Extendos crashed and locked up the Sony. I informed Roger and he said the I should at least should be able to get the drive to read. I could not do that and he said to send the drive back. I knew the drive was fine since HDDriver recognized it and did not have a problem with it. There had to be another problem. It turned out part of the Extendos package was not fully upgraded. When I upgraded fully, Extendos recognized the drive and gave me an icon on my desktop. I could read CDISO CD's, but nothing else. This usually means the computer does not recognize the CD drive as a CD-RW drive but only recognizes it as a CD-R drive. To make a long story short, I worked with Roger for about 3 weeks. Extendos is able to due "traces" of it's activity and put them in a INF file. By sending Roger these INF files, he was able to adjust Extendos so that my Sony CD drive now works great with my Hades. He deserves our support. Please goto the Anodyne website and look at all of the great Atari products at http://www.anodynesoftware.com/.

I can say that it is currently working on an STE with 4 megs. As it hasn't been discussed yet, I really cannot give you an exact requirement. But, HighWire does need a Multitasking OS (MINT and Magic tested) and Speedo Fonts to display the text (NVDI or Speedo GDOS).

Check out the HighWire forum

Hi Steve!

It's only the occasional usenet message that causes a crash - it
may be ones which have over-long 'reply to' lines. It's repeatable
(for the one message) but it may well be due to a fault in Cixread.

Valves? I prefer quenched spark transmissions myself! Splashes all
over the waveband :-)

Merry Christmas!

Hi Steve!

Many thanks for putting it so clearly. No, I didn't do this
translation - I think ASH had it done locally. Seems strange there
is nothing about it in the manual - only something hidden deep in
the README.TXT.

Happy (or heapy) Crumblemass to you!

/Peter/

Thanks for the feedback - it must be something with my Sting or
CABOVL.CFG settings then.

It does take a while as the posts can be quite extensive if you read
back that far!

>The URL is quite long, and adding it to the hotlist was a bad idea: error =
>-1001, unable to write the hotlist file.

Yes, I just bookmark the initial page. When you select the options, it
adds each option setting to the URL as alist of parameters. I'm quite
surprised CAB handles it at all!

Hi Tom!

Yes please! I'd like to get the whole Cyber suite working on a Falcon.
Cyber Sculpt at least seems to run in 256 greyscale 640*400, though
higher resolutions would be better.

Regards, /Peter/

|
| >Are you still having that problem, isn't it time CIX was dragged forward
| >into the 15th century, fit some valves at least.

| Erm, there's nothing wrong with CiX -

I meant that to be CIX-Read, it seems my speelcheeker got busy there.

| it's the antedeluvian software that Peter's using to grab his news that's
the problem.

I've not heard of that platform, is that antedeluvian an x86 or a 68xxx
powered machine??.
What have I told you about using big words with me, they'll only be met with
sarcasm!!!.

Talking of speelcheeker's, this seems to be the suggested spelling as given
by Office XP. "antediluvian".

Hi,
Suggestion (If I understand part of the problem):
I've been hitting the Backspace key until I see the vertical marker
close enough to creat a truncated line down to 8+3 (or shorter) and CAB
then saves the file ok.

I have a bundle of Atari stuff here and I now need the wardrobe space
for other things
and am finding it hard to just put the lot in the bin (at least without
a fight).

I have:

a largeish pile of ST Format magazines
all of the cover disks
heaps of other software (mainly games)
a one meg STFM
a four meg STE
two colour monitors
one hi res mono monitor
mice and joysticks
monitor stands
laminated circuit diagrams
and a bag of chips (assorted memory, TOS, and cpu) - no fish
tho :-{

anyone interested.....?

Regards
Kerry

I`ve reposted this to an appropriate newsgroup that might be interested in
this stuff.
I believe the original poster is in queensland somewhere.

As far as I can tell Phototip does work on my Hades equipped with an ATI Mach 64 card. As driver I use NovaVDI 2.67.
I tried it under 256 colors and true color. I noticed one strange thing. The mini pictures create by HTML catalog are displayed (true color) with faulty colors (blue). But opened they are in the right colors though.

>
>Obviously you didn't translate the help files for CAB!?!? 8-).

I thought that that was Joe Connor, Steve! :-)

There are some problems with the bubblegem-like help files for later versions of CAB though, as they were compiled to fit the layout of the resource files ten being used. Now, some of them don't refer to the right buttons or are missing altogether.

Has anyone come across this little number?

A very useful tool for editing ST-Guide STG files, you can run a test to see if all your links work, and it uses the Olga protocol to instantly reflect changes made in said STG files.

Pity that Jaysoft (Jan Krupka and Stanislav Opichal) seem to have dropped development. My email of encouragement was returned with a not known at this address type error, does anyone have an up-to-date address, or any news about this program?

Cheers

Hello,

Until recently I was using Freedom fileselector but as I was getting
more and more probs with it I'm using Boxkite (latest version) now.
The prob with Boxkite is that I can't see the date.
I see something like this
browsers <dir> 12
hugo.inf 1356 04

Normally I should get this
browsers <dir> 11.12.1999 10:27
hugo.inf 1356 13.04.1999 20:55
It seems boxkite only display the month.
Anyone an idea about this.
ps. I'm doing this on a Hades running freeMiNT/N_AES 2.0.0

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hello.

Please forgive the crosspost, but I am not an Atari user and as such
didn't know which machine I needed.

I am in need of a WD1772 chip for a piece of equipment, and searching the
'net found that Atari's used the same chip in some hardware. So I figured
someone might know where I could go.

Does anybody know where I can obtain this chip? I only need one, but would
order in bulk if required to get some for spares.

Many thanks,
Patrick

Source record: 39384

Hi Tom,

It's amazing to read the posting of one of the top programmers in the 16/32 bit Atari computers history. And still better, to have you back to the Atari users community :).

I have to say that I'm another proud owner of almost all of your Cyber Series. All original copies, of curse. Cad 3D 2 was purchased as long ago as 1989. I now that it is the ancestor of the now world wide famous 3D Studio!!!.

Yes, adapt your software to run in any GEM resolution, and multitask happily under Mint, even without providing new features, would give a hole new breath of life to our ancient computers, not to mention the clones or the hopefully forthcoming Pegasus (MC Coldfire 300 MHZ).

The task would'nt be too hard with the source code and updated system documentation. I offer myself to help you to test it in some "advanced" graphic setup as a Falcon with Eclipse and ATI Rage IIc board. I neither doubt that quite a number of people would be interested in that upgrade and pay for it.

I expect another users to add here their opinion.

Finally I don't want to finish my posting without wishing the best for you and thank you for giving us such wonderful pieces of software.

Merry Christmas and best regards.

6126. ???Upgradeing to MagiC 6.2???

Source record: 39390

It's that time of year again ;)
Trying to get my CT2B Falcon all up to date.

I'd remembered reading months back that a patch to update
MagiC from 6.1 to 6.2 was to be released as a download soon.
So...I browsed the site yesterday and found and downloaded
the patch.

Here's the catch. I don't understand the docs. No english :/
So I have a few questions:

1. What improvements does the upgrade offer?

2. Does it work on a SCSI only CT2B Falcon?
(patched for CT2 and to skip IDE scan at boot)

3. Will this patch work on my english version? (assumeing the only
things that are really any different are keytables and rsc files)?

4. If the answer to questions 2 and 3 are yes...how do I install the
patch?

5. Finally, are there any known applications that upgrading to 6.2
breaks?

Thanks,
Brian

I'm using a Falcon without an FPU. Is a 68882 easy to get, and what should
I pay for one ?

6132. seeking tiny fuge for mintnet (was on umich site)

Newsgroup: comp.sys.atari.st
Date: 2001-12-24 20:11:53 UTC
From: bjr@localink4.com
Message-ID: <78d87076.0112241211.5a4f5b19@posting.google.com>
Source record: 39296

atari.archive.umich is no more?
Well...perhaps someone out there can help me.

The ancient hard drive with my favorite mint set-up bit the dust.
Somehow I've neglected to back up my copy of tiny fugue and despite
scouring dozens of atari ftp sites I can't find it again.

I know it was once located at atari.archive.umich.edu in the mint
section.
It's a binary distribution of tiny fugue ported for mintnet. Maybe
someone out there has a personal copy of these old archives (I seem to
recall someone did CD-R back ups of all the great old ftp sites) or
knows of a place that still mirrors the site?

I'd just compile tf myself from sources, but it don't compile on my
KEMD setup (not even close...and I'm no programmer).

Thanks,
Brian

These may also be used in Commodore 64 drives (1541s?)? I have heard them
give
Atari ST's as a good source of cannibalizing for their floppy controllers so
Atari
users should do likewise.

Yeah that WWD1772 was used in TRS-80 floppy drives as well so you might check comp.sys.tandy .

It's just version 0.01, so we shouldn't expect too much, but I tried it
and especially the speed with which it showed some htnl pages I tried to
view impressed me. And if I change the size of the window it doesn't take
ages to redraw the screen, like in CAB. It looks very promising. Keep up
the good work, development team !

I think that you don't unterstand me, I just want to give you some ZIP file
with RSC file with black and white muisc ATARI icons, and there is nothing
to do (no editing, I've made it ...)

There is no problem, I put it them on my ATARI web site and if in the future
you want them, you can download them :-)

> but that's it! No more icon editing for me ;-)
> You can find them by going to:
>
> http://www.notator.org/html/contributions.html#zipdrive

Thanks :-)
I've got it too :-)

Regards

It may be some consolation that non-working software is not limited
to obscure low-budget platforms such as ours. Recently I had to do
something at work in Unigraphics (beside Catia and ProEngineer one of the
three serious CADD softwares in the world)... worth several tens of
kilodollars... and found that it does not calculate masses of solids
correctly in metric units (wrong by a factor of 1000!).

On a slightly more amusing side, some time ago I was trying to configure
DECnet Phase V on an Alpha running OpenVMS. Apart from being unnecessary
complicated relative to Phase IV, it has an option which is supposed to
avoid collisions and congestions on network with high traffic. But the
docs say that this option does not work well when the network is heavily
loaded (sic! why else would one need it?) so it is OFF by default!

Remember the right address is <URI:http://www.rom-logicware.com>
AFAIK there is no demo of 9.15 available for Atari. Only the pc version
is ready.

Seassonal greetings to every one
Martin

I think you missed the point. The fact is that I don't see the timestamp
at all, only the month.
Anyway I found the problem. The culprit was dataform.cpx. Dataform.cpx
was set to use the American way of showing dates, months/day/year. After
I switched over to the Belgian way of showing dates, day/month/year,
Boxkite displayed the timestamps correctly.

Yes but there is no path from 6.01 to 6.1, if anybody can help about this
please contact me.

Nobody was able to tell me what 6.2 has exactly more then 6.00, I am
particularly interested about using more then one serial port and tcp/ip on
ethernet of Mac or PC.

Martin,

I wouldn't pay more than $25 US for one. If you can pick up an old Mac IIx
or IIfx, you can get one out of them. The Mac II machine used the 68881.

Also, check with the surplus Mac part places for one. Best Electronics
would have some also.

Very long ago, when I was working on a big mainframe, I was sifting through
the software notices from the manufacturer and read the following:

"There is an error in the X..... forcasting system such that it produces
incorrect forcasts."

:-)

Definitely not 1541 - these used GCR recording with a custom chip.

Maybe the 1581 or other newer models which could do GCR as well as MFM.

They are not produced anymore - a friend got some of the last in Germany as
stock for replacements on his industrial CPU boards.

Where do you live? If in or near Germany, I should still have some that were
desoldered from old ST boards.

Nobody has a TT emulator that runs on a PC, do they? Or, is there an ST emulator that would allow me to test the various resolutions? The inital phase would be pretty hard without something here that would allow me to do the trials on.

> The task would'nt be too hard with the source code and updated system

Having not kept up with the Atari hardware after moving to the PC, I'm intrigued about what kind of capabilities these machines have. I originally left the Atari market (reluctantly) after they failed to deliver on promised upgrades, like the math coprocessor, faster processors, etc. for so long. If you have any system documentation in electronic form, I'd love to get it.

If you want to email me anything, I took the anti-spam email name off my news reader and put my real email address on it, just remove the 'X' from the front of the email address.

> Finally I don't want to finish my posting without wishing the best for you
> and thank you for giving us such wonderful pieces of software.

Thanks. The Atari software was the foundation for everything that I did later on the PC, and I'll never forget the fun I had creating it. I think it's great that there are people still using it, and if possible I'd enjoy making it more useful for you guys.

> Merry Christmas and best regards.

As far as I know, there are no working TT emulators, but there are some free ST emulators (some pretty faithful to the original) around that allow to use extended resolutions but no more colors or palette than the original computer (16/4096 in an STE). Then you could use it at, let's say, 1280x960x16 colours.

I'll write you about some of us that have TTs or clones and would be happy to act as beta testers for such a development.

> Having not kept up with the Atari hardware after moving to the PC, I'm

> electronic form, I'd love to get it.

Well, sadly it didn't evolve too much after 1990. I will try to sumarize the (most common) models that appeared after that year:

1. Falcon (last computer made by Atari):

16 MHz 68030, 16 MHz 68882 (optional), 16 bit data bus
(this with ST compatibility in mind). Upgreadable to 14 MB ST RAM.
32 MHz MC56001 DSP 20 Mips with 96 KB of ultra fast RAM. Can be used for sound and graphics processing. It also has a blitter chip. Built in video High color (16 bit palette). Max 16 bit color resolution: 640x240 or 320x480. Max 8 bit color resolution: 640x480. The Falcon features an expansion 16bit direct to processor upgrade bus conector. With a PCI to Falcon bus adaptor there is avaliable the ATI 3D Charger (Rage IIc) PCI accelerator Card.

Many people have their Falcons upgraded with other expansion boards, mainly with 68030 50 Mhz or 68040 33 Mhz. These admit TT RAM up to 64 MB at least.

There is planned a 68060 - 100 Mhz upgrade board.

2. Hades
Similar concept to the TT, modified TOS 3.06. MC68040/33 MHz or MC68060/66 MHz PCI ET6000 graphic card. A lot of RAM (I think that up to 512 MB).

3. Milan
Another TT clone, this time 32 bit RAM is treated as ST RAM for better compatibility. MC68040/25 MHz or MC68060/33? MHz. RAM up to 128 MB. PCI S3 Trio 64 v+ graphic card.

As you can see all these models are capable of 24bit color depths in 640x480 resolution and at least 800x600 pixels with 16 bit color depth.

As I mentioned earlier, a new computer (codenamed Pegasus) is under development by Hades designers with AGP graphics card and MC Coldfire - 300 MHz. This processor has a subset of 68000 instructions (more than 80%). According with Motorola estimations and with both processors running code within that subset (I mean that the Coldfire has not to emulate the missing 68000 instructions), a 300 MHZ Coldfire benchmarks up to a thousand times faster than ST's original 8 MHz 68000. Also worth mentioning, Pegasus is going to feature a Motorola DSP (56301) PCI card as standard.

> If you want to email me anything, I took the anti-spam email name off my
> news reader and put my real email address on it, just remove the 'X'
> from the front of the email address.

I will do it for sure, but I prefered to reply this time in the newsgroup to allow other users to share their info and contribute. Come on all you!!! perhaps they haven't noticed the interest of the thread. I'll direct you to the info avaliable in the net.

The first person who tried to help you (Henk Robbers) is another great programmer that is coding an open source, modern multitasking AES replacement. He is doing an incredibly good work and it is now in a quite useable status. He works with his old TT and surely can provide you with system call documentation about multitasking AES and the multitasking BSD-like GEMDOS kernel (Mint) that are the modern standard in Atari computing environment.

The other part of the OS, VDI, hasn't improved a lot, except for Bezier curves and vector fonts support (provided by a new GDOS). The two actual offerings, NVDI commercial) and fVDI (open source) both support True Color bitmaps, as apparently all VDI versions did in the past.

That's certainly true. The Atari TT, the Amiga 3000 and the Mac IIci are
so similar to each other, it's almost scary! Talk about parallel
evolution. One of them (guess which!) has aged less than gracefully,
though, so whereas the IIci can be had for less than a McDonalds meal,
getting an unexpanded A3k or TT at 1000 EUR is difficult.

From: Steve Sweet <stevesweet@freeuk.com>
Message-ID: <1009504698.17228.0@eurus.uk.clara.net>
Source record: 39260

Hi Hallvard

| > I've any music ATARI icons in black and white format, may be interesting
you
| > ?
|
| No thanks. I'm done editing icons for now!!! These things take LOTS of
| time and patience.

Coffee??, biscuits??..

| I've just uploaded ZIP/JAZ/Syquest related icons now,
| but that's it! No more icon editing for me ;-)

Its easier with a decent Icon Editor, have you tried Resourcemaster?,
there's Demo's available??.
Also there was an Icon Ripper about recently, i think it was by some french
guy, that does a real nice job of borroiwng from Billy-Boy Gates.

From: ebaiz@skyenet.net
Message-ID: <1cFW7.33$M92.40278@newsfeed.slurp.net>
Source record: 39342

Hello all,

I just downloaded the update to Porthos. Version 1.28 works MUCH better and now loads in the large PDF's that I was having trouble with. Now these large file do not cause my Hades to crash. Version 1.28 offer exporting of images files without Papillon. Now you can export the images as TIFF files. This works fine to a point, but I ran into some problems. Porthos exports the images to the TIFF files but sometimes some of the TIFF files are not readable. I zipped some of these un-readable files and sent them to the author. Still, I am satisified with the upgrade.

6182. HELP! - Edith.PRG has bit me...

Newsgroup: comp.sys.atari.st
Date: 2001-12-27 18:37:05 UTC
From: luedmonds@compuserve.com
Message-ID: <90fd37c9.0112271037.74a9ad86@posting.google.com>
Source record: 39249

Hello All,

...been getting my Atari ST working again for C-Lab with a SCSI (Jaz) drive installed with Uwe Seimert's HDDRIVER. What a lot of great software out there on the Net for this venerable machine. It was all going fine until:

I added Edith.PRG to the root and then - stupidly - reset the computer. Now it's stuck in a crashing loop! I guess I should (as told) have also included the .RSC file with it in the same folder.

Is there any hope? Delete edith.PRG is my goal, but how to access it if the Jaz keeps crashing in a loop? I have a PC, but no SCSI... And I do not know even if a PC Jaz setup will read an Atari Jaz setup.

Anyone who knowsa bit, please help.

much ta!

Lu

No, there is no such thing. The closest hit would probably be the emerging "Aranym" Falcon emulator, but I believe it is still in a very experimental phase.

>Or, is there an ST emulator that would allow me to test the various resolutions?

At least three ST emulators on PC offer extended resolutions (Tosbox, Gemulator, MagicPC), and maybe others do that also. From what people say, I believe that MagicPC would be the best choice for testing verious graphic modes in multitasing environment. Tosbox and Gemulator can also run mulstitasking, but with older versions of Mint. Gemulator and MagicPC are very fast, surpassing in speed real TTs and Falcons. Nowever, the weak point of all ST emulators is floating-point performance which is awful, and I suppose it would be among the more important features for your software.

Best regards;

Try booting from the floppy drive - simply stick a blank disk and
press A while the computer boots I think, or disconnect the SCSI lead.
Then run HDDRIVER from its initial disk to install the hard disk
driver in memory and you should then be able to access your hard disk
in order to delete the offending program.

Next step - install a boot manager! This will allow you to interrupt
the boot sequence and choose which programs you want to auto run.

I've erased both FAT by misstake. I remember doing a FAT reconstruction
"by hand" a few years ago. Of course you still need to find the first
sector of each files and I don't care about binaries as this partition
was me assembly sources (so text files).

Thanks anyway.

6189. XaAES v0.936

Newsgroup: comp.sys.atari.st
Date: 2001-12-27 23:04:36 UTC
From: Henk Robbers <h.robbers@chello.nl>
Message-ID: <3C2BA8DB.31600B9C@chello.nl>
Source record: 39265

LS

There is a new version available on my homepage (url in sig)

Changes:

1 Fixed a few glitches in live moving and sizing.
Programs that snap their windows on certain pixel boundaries were mostly
affected.

2 Integrated debug configuring into options block.
It is now much easier to restrict debug output to one or more applications.
There is no need anymore to know the pid.

example:

```
options PC,LC
{
windows thinwork
debugpoint wind,widg,evnt,multi,m
}

options OLGA
{
debugpoint trap
}
```

If you are a programmer and one of your programs behaves strange
and you suspect it to be a AES thingy, use XaAESdbg and MiNT.
Or you might simply want to know how other programmers do it. :-)

3 Greatly improved the widget handling.
It is now possible to have any widget size.
That is: All widgets must have the same sizes. XaAES uses the closer widget
to determine this size. The size influences the sizes of the window borders.

A possible 3D enlargement effect for non-icon widgets is recognized.

As a demonstrtation I made 6 flavours of boxchar widget sets.

I also redid the xa_mono.rsc, so this is now up to date again.
It is the same as xaaes.rsc but all colour icons are changed to mono icons.

If you use a boxchar widget rsc and xa_mono.rsc you might save upto
100 Kb in 256 colours.

It even works with rectangular widgets :-) See cbox1214.rsc
You'll see that the vertical slider is narrower than the horizontal slider.
Generally: horizontal bars get the height of the widgets,

vertical bars get the width of the widgets.

All widget resources except the default are held in the (new) folder
WIDGETS

>

Put everything including dialogues in windows and your program is perfectly
suited for multitasking. Putting stuff in windows surely wil automatically
force resolution independence.
That is basically all there is.

For a GEM program there is no need to know which kernel is running.
The AES offers everything you need. Including information about itself.

Do not use the wdialog extensions of MagiC! This software relies on calling back
from the AES into application code. This is so proposterously against all rules,
that explaining why would mean quoting 50 years of computing history in this medium.
;-)

I don't remember if the ST does the same thing, but MS-DOS has two FAT tables, stored in different sectors. Search through the floppy from the start of the disk and see if you come across another FAT table. If it's there, just copy it to where the first FAT table is supposed to go. It's been way too long, so I couldn't even offer the name of a sector editor that'd do it. Presumably there's at least one shareware/PD one on one of the FTP sites.

6194. New NVDI 5 user question(s)

Newsgroup: comp.sys.atari.st
Date: 2001-12-28 05:30:07 UTC
From: Ken Kosut <kjcat@shell.voyager.net>
Message-ID: <3c2c061c$0$43579$272ea4a1@news.execpc.com>
Source record: 39263

Hello,

I am having some problems printing a file with NVDI 5.
Prior to this, I was using SpeedoGDOS/ATARIWORKS with no problems.

It is my understanding that NVDI 5 replaces SpeedoGDOS.
So I took SpeedoGDOS out.
When I boot ATARIWORKS it prompts me for GDOS. (Unable to print because
GDOS is not loaded)
So I put GDOS 1.x in. I boot ATARIWORKS, but now it says,
program will not work in low resolution.
I set the resolution in MAGIC. I do not think it is low.
If I reinstall SpeedoGDOS, it will look for EXTEND.SYS
According to the NVDI manual, EXTEND.SYS doesn't seem to be needed.
Only ASSIGN.SYS

And how do I actually print the file? Do I use the print command in
ATARIWORKS, or do I drag the .STW file over the printer icon in MAGIC?
When I drag the file over the icon, it starts but then says program
terminated.

I know I have NVDI setup properly. I went through it very carefully.

Thanks for any light shed on this matter.

ken

I hope you have the HDDRIVER programs also on a floppydisk ? Put this disk in the floppy drive and reboot while holding the ALT key. You should be able to boot from drive a: now. If hddriver.prg didn't run from an auto folder on the floppy, run it manually. Now, after installing the drives on the desktop, you should be able to access your Jaz drive.

If I,m wrong, please correct me Uwe !

> button)...

If you can read German and are willing to spend money for commercial
software have a look at DISKUS: http://www.seimet.de/atari_english.html
DISKUS offers a lot of functions for recovering data, including
functions that help to repair erased FATs.
Note that in general you can only repair much of the FAT if the
partition is not too fragmented. The higher the level of fragmentation,
the harder it is to undo the damage.

> the second is a complete copy of the first. Perhaps that helps?

No, there is no such option in HDDRIVER. HDDRIVER is not a tool for
checking and repairing data. It's a hard disk driver in the first
place.
Usually both FATs are written at the same time, so using the copy may
work, but most of the time it doesn't ;-).
Note that it is possible up to a certain degree to let software decide
which clusters belong to which file. DISKUS, in particular, if the
partition is not fragmented, or at least there is only minor
fragmentation, and the directory entries are still present and correct,
can recover the complete partition, even if the FAT is completely
destroyed. You can also do this manually, but this will take you a huge
amount of time ...

Date: 2001-12-28 10:39:00 UTC
From: Peter_Schneider@su2.maus.de
Message-ID: <200112281139.a30492@su2.maus.de>
Source record: 39212

Hi Ken,

KK>It is my understanding that NVDI 5 replaces SpeedoGDOS.
to be more precise: The GDOS part of NVDI may replace the GDOS part of Speedo.

If you installed NVDI properly, there should be a NVDICONF.ACC (or CPX) to configure NVDI. This ACC or CPX can switch on/out GDOS.

KK>(Unable to print because GDOS is not loaded)
A whatever GDOS program must have run from the AUTO folder (e.g. SPDGDOS.PRG, NVDI.PRG, AMCGDOS.PRG...), if any of your programs is to print via GDOS.

KK>If I reinstall SpeedoGDOS, it will look for EXTEND.SYS According to
KK>the NVDI manual, EXTEND.SYS doesn't seem to be needed.
That's quite normal for EXTEND.SYS is an 'extension' to the usual ASSIGN.SYS, but EXTEND.SYS is needed by Speedo only.

KK>Do I use the print command in ATARIWORKS, or do I drag the .STW file
KK>over the printer icon in MAGIC?
I don't think Magic's printer icon is dedicated to printing non-ASCII files. Correct me if I'm wrong. You should use AtariWorks's printer dialog.

There should be an ASCII file NVDI.INF that shows the font paths to the system.

> No, there is no such thing. The closest hit would probably be the emerging
> "Aranym" Falcon emulator, but I believe it is still in a very experimental
> phase.

First. Aranym is not an Falcon emulator. Yes, it uses TOS4.04 and it emulates Videl a Falcon IDE, but all these parts will be replaced by native drivers for VDI (already done), XHDI and opensource TOS replacement (EmuTOS) in the future.

Second. Aranym is pretty usable, yet. It has full 68040 and (fast !) 68882 emulation, up to 4GB of RAM, hardware accelerated graphic (special fVDI driver), direct or virtual HDD and FDD support and all this is pretty fast. There is only a few missing parts as sound, networking, MIDI and serial ports.

Best Regards,

Ctirad

>
>Interesting piece of design work....

Definitely - except for the very cheap mechanical design and missing track-0
detector.

I don't have my schematics here, but
http://www.devili.iki.fi/Computers/Commodore/C1541/Service_Manual/Page_10.html
states:

UC2 is a VIA also. During a write operation the microprocessor passes the
data to be recorded to Port A of UC2. The data is then loaded into the PLA
parallel port (YB0-YB7). The PLA contains a shift register which converts
the parallel data into serial data. The PLA generates signals on pins 2, 3,
4, and 40 which control the write amplifier circuits on D-IN input on pin 24
of the PLA. The PLA shift register converts serial data into parallel data
that is latched at the parallel port (YB0-YB7). The register converts serial
data into parallel data that is latched at the parallel port (YB0-YB7). The
microprocessor reads the parallel data that is latched at the parallel port
(YB0-YB7). The microprocessor reads the parallel PLA output by reading Port
A of UC2 when BYTE READY on pin 39 goes "low."

I would guess that the 6502 would be too slow to bit-bang GCR-coded serial
data directly on a single VIA pin - and it would need the multiple rate on
reading to correctly recover the single bits, lacking an external PLL.

It seems there was an older version of the 1541 without the PLA, with
discrete logic instead - I never had one of these.

Hi,

Does anyone know of a quartet music player which is compatible
with the ATARI TT? (*.4V Files).

I have tried the quartet 3 player by Dan Panke but it just bombs out after
selecting my .set file, but does work with the samples that came with the
program.

I no-longer have a copy of Quartet, but the songs I am trying to play used
to work.

Any suggestions/help would be most gratefully accepted.

Thanks,

Richard.

I don't see why the CT60 will not be compatible with it and if there is a
problem it's pretty easy to install/remove AFAIK. It does simply
doubleclock the CPU.

I think I got my first TOS 2.06 upgrade from Analogic in South London
and I didn't get a "manual". I think it was a two page photocopy,
which I supplemented with a review of TOS 3.06 by Paul Rossiter in ST
Applications and other magazine reviews.

Was there a manual, then?

I don't bother with CixRead for newsgroups. It treats newsgroups as Email and doesn't thread it, so I use a combo of Dialer/STinG/Newsie and Everest to log onto CiX and pick up this area. Much better and doesn't get bogged down with the errors Peter gets.

I get all my Email replies redirected to Cixread's Email account, which tends to be fine for that purpose. I'd be surprised if anyone knew the account/domain I collect newsgroups with...

I only used Speedo for a very short while and can't remember it tbh,
and I've never used Atariworks, so none of this may be very helpful,
but...

Did you use Magic with Atariworks before? What resolution are you
running in? What is showing in your new Assign.sys file for the
driver? Is it the new NVDI driver for your printer? Is the path ok?

Have you pointed Atariworks printer driver to point at the new NVDI
printer driver? (Not sure if AW needs to do this, but it was a
problem I had with Papyrus at one time).

> And how do I actually print the file? Do I use the print command in
> ATARIWORKS, or do I drag the .STW file over the printer icon in
> MAGIC?

You should just print from Atariworks, I'd guess...

> I know I have NVDI setup properly. I went through it very carefully.

I've thought that before now, too...

Anyone know what became of Jim Kent?

I use to create 3D text animations in CAD 3D then add other graphics to them
in CyberPaint. Now being able to use both of them again would be a blast!

Tom - it is great seeing you pop into the atari world again.

The power supply that the link goes to below is NOT a micro ATX power supply.
Why it says it's one is a big question as it's way too big.

A micro ATX power supply should only be 1.25" tall so that it will fit in a 1U
rack case. The one below is twice the height. Besides, I believe the Falcon
case is about 2 1/4" high if my memory is correct.

I have collected many system docs in digital form for my Atari SDK CD so if
you need anything, just ask me.

BTW, the message pipeline is finally used heavily by modern Atari apps :-)
And it would be nice to see Degas back, too.

No.

> What resolution are you running in?
640 x 400 interlaced

What is showing in your new Assign.sys file for the driver?
Path = F:\GEMSYS - (this might be the problem, I'll have to check)
01p - 10p Screen.sys files
21 PCL.sys
22 ESCP2.sys
23 CANON.sys
24 MACPRN.sys
25 PIN.sys
26 ATARILS.sys
31 META.sys
61 MEMORY.sys
81 NTOFFICE.sys
91 IMG.sys

Is it the new NVDI driver for your printer? Is the path ok?
Well, I just want to print to a dot matrix, so I wish to use 25 PIN.sys
Will double check path.

> Have you pointed Atariworks printer driver to point at the new NVDI
> printer driver?
I can't point to a driver in Atariworks. SpeedoGDOS came with a printer

driver utility which allowed me to choose printers.

>Applications and other magazine reviews.

>Was there a manual, then?

The one I have I would say was probably a photcopy or duplicated.The
cover states it is TOS 2.06 USER MANUAL. It has 38 pages,one of which
is devoted to the usual Copyright notice and disclaimers.It also
states that the manual is the copyright product of COMPO Software.
It covers all items from the desk menu through to Advanced Hard Disk
Utilities Disk files.

In with the disks was also a small change of address slip for a firm
(?) in the States,no name of the firm concerned though. So I surmise
that the upgrade was originally from the States and performed by TUS.

6223. I've got a digital camera!

Newsgroup: comp.sys.atari.st
Date: 2001-12-29 16:41:01 UTC
From: osian@underwearzetnet.co.uk
Message-ID: <3c2df21d$0$21144@news.zetnet.co.uk>
Source record: 39196

Bought today - Olympus C700UZ, 150UKP off the usual price in the Argos sale!

I have been able to take photos and view them straight away using Imagecopy on my Falcon, using the SCSI card reader I bought some time ago. Don't even need to go through Phototip.

I've had a couple of heart-stopping moments. Sometimes, Imagecopy can't display the picture (and neither can Phototip) - it says it's not a valid picture file. Even though I displayed it perfectly once before! I think it may have something to do with 'Media Change' becuase after putting the card back in the camera (to see if the picture was still OK) and then putting it back in the card reader, I could view it again.

Now I need to experiment with the movie mode...

>drivers for VDI (already done), XHDI and opensource TOS replacement (EmuTOS)

Thank you for the explanation; this is of course a much better concept than
just emulating a Falcon [though, if Aranym looks and feels like a fast Falcon
it may be hairsplitting a bit whether or not it is a Falcon emulator :)];

>Yes, it uses TOS4.04

For curiosity's sake, had anyone tried to use it with the ill-fated TOS4.92
(the one having a multitasking AES; Ok, I know it's far from perfect...)?

>Second. Aranym is pretty usable, yet. It has full 68040 and (fast !) 68882
>emulation

I understand that only the sources are currently available. Any particular
reason for not making available the executables for the currently usable
platforms as well (understanding, of course that this is not a finished
product)?

Has there been thougts or efforts on making it run on certain hardware
without an underlying OS (or, at least, with a hidden underlying OS)?

Hi Ken,

KK>Well, I just want to print to a dot matrix, so I wish to use 25
KK>PIN.sys Will double check path.
My AtariWorks permits me to print via the 21 and 23 devices only, my
ASSIGN.SYS reading like this:
...
21 PCL.SYS ; Seitendrucker
PRES9.FNT
PRES10.FNT
PRES12.FNT
22 PIN.SYS ; 24-Nadel-Drucker
23 IMG.SYS ; 300 dpi IMGs
31 META.SYS ; METAFILE-Output
41 IMG.SYS
...

KK>I can't point to a driver in Atariworks.
My AtariWorks prompts me for a GDOS printing device (21-30), when I
ask it to print, all devices except 21 and 23 being disabled.

I recommend you to put WDIALOG.PRG into your AUTO folder and to make
it run as one of the last ones. At least with PAPILLON that helps when
printing via GDOS.

Hnmm, did you read it right - 150 pounds *off*! It cost 450, but it was 600 before Christmas. (They had an offer until Xmas Eve - buy the camera and get a 32Mb card and a bag half price. Sounded like a good offer, but why only until Xmas Eve? I gambled on the camera coming down in price in the sales, and sure enough it did. I got the camera and 32MB card as well, had to pay full price for them, but the whole package was 520 instead of 650 before Xmas).

The card reader was 200, plus a SmartMedia adaptor which was an extra 45.

Not cheap though - if you've got a PC, don't bother trying to connect the camera to an Atari! However, I must say the SCSI card reader route is actually quicker and more convenient than using USB and software to donwload the picture.

> to donwload the picture.

I also have such a card reader, on all 3 of my machines in fact. Not only
do I use them for the camera, but also to move large amounts of data from
one machine to the next. I have noticed occationally changing the card
on the fly does result in some read errors. The solution is to force a
media change first thing after you insert the card into the reader.
Fetch the file MEDIACHG.* , it's a tiny little prg that will do this forced
media change.

>Bought today - Olympus C700UZ,
Congratulations! I've bought 1.5 year ago the 2020
version of Olympus. Works great with Phototip. Even
the movies are downloaded despite that they got
another extension: just change it into .MOV and play
them with Aniplayer....The USB port is always slower
because it is not really a 'hardware' port.

Enjoy your weekend!

Is the PowerUp mod a 32MHz CPU? I am looking for a Falcon suitable for
fitting a CT60 in it!

I am interested, and I live in Leeds!!!

Neil :-)

I've since worked out that there are two distinct problems:

1) Sometimes the computer doesn't recognise that the drive exists.
MEDIACHG solves that.

2) Sometimes, neither Imagecopy nor Phototip will read the file.
Imagecopy reports "invalid file" and Phototip says "Premature end of
file". I now think this is due to the picture format. On the Olympus
cameras, you have the choice of 3 formats: TIFF, HQ, and SQ. Nothing
will read HQ format in my experience, SQ is OK. I've yet to try TIFF,
but I can't see that it would be a problem.

The files on my camera are saved as .MOV anyway - and Aniplayer will play them direct from the card. However, I have a problem with my DSP chip, also Aniplayer doesn't seem to work in conjunction with fVDI, so I can't really make use of this!

Ah, I see. I have not tried all the camera image options. I also have an
Olympus, model D-490 Zoom. The movies work great, however I have NVDI
on my Hades. Hopefully fVDI will keep improving.

I've been playing around with WENSUITE 330b, its working pretty good but any URL that has pictures on it, they look weak not close to the quality that CAB 2.7 puts out on my TT030. Am I doing something wrong or is the Prg just weak in that area ?? Also having a problem with the dialer, it is reluctant to turn the modem dial tone on, after banging on the "Connect Button" several times it will dial out and conect..

Any thoughts on this program ???

Thanks, Donner....

Hi Chris,

>Nothing
>will read HQ format in my experience

What do you mean by that? I've got loads of pictures
in all three resolutions (SQ, HQ and SHQ) and there
were no problems loading and dispaying them...Or do I
understand you incorrectly?

And that also counts for Imagecopy....It's a bit slow
with the JPEG's but it does its job. But maybe the
JPEG kind is changed over the time (my camera is about
1.5 years old). And on the TT the .MOV files are
rather slow too but dispayable. I hope you wil all
figure it out between the different resolutions and
using them.

I've a few Falcons and have considered letting at least one go.
From mild to wild, but they are not cheap. You'll have to make an offer.

1. STD Falcon case, 2.5" 1.2 gig Conner IDE, 14mb ST RAM/ With Gizzmo,
very nice condition. Buffer/DMA mod. All Standard software that was
included with the Falcon/hard disk model. What were these new?

2. Falcon with Mighty Sonic 32. 14megs ST Ram, 32 Megs fast ram. The Mighty
Sonic (PGA 68030) accelerator is clocked at 40Mhz with a Nimisis.
Nice and stable, runs all Falcon software. This one can be fitted with
an ATI Mach 64 ISA video card and NOVA adapter (you'll loose 10mb of the ST
Ram, but still have 32 mb of fast ram), or a PAL version of the
Expose card. I use an Aiwa MX10 dual standard VCR with NTSC to PAL output
to capture video. Both cards can be fitted at once as well. I also have
a 286 PC Falcon Speed card that could be fitted. The only case I have
now is a Wizztronics Falcon Rack that all of this can fit into. With just
one of the other cards, it will fit snugly into a Mark X case. This is a
kind of build the machine to what you want type deal. Very expensive, but
you have a decent DTP/FX machines that is faster than a stock TT. I have
so much extra stuff laying around, you would have to dream up what you
would like and let me know. Suggested for experienced TOS users.

3. Basically the same setup as above but with an Afterburner 040. I have
3 Expose cards, 2 NOVA cards, so I won't loose out either way. Until
the CT060 is finished (I have 3 68060's just waiting:) This is the best
Atari you can get (unless you can get an Eclipse FX card). You would
have to be insane to want to build this machine, I know..... Money is
no object when you fall off this far.

Cheers,
Mike

Please try the latest version 2.18 who test fVDI and by-pass the problem
(the transformation motorola->intel format inside the VDI function
vro_cpyfm). The main problem was that Aniplayer uses screen informations
(another VDI function vq_scrninfo introduced for graphic cards), but
there are no function who returns the transformation caused by fVDI.
For information, there are _NO_ transformation in Intel format with the
other drivers (like NVDI, NOVA cards, etc..) when the specific format
is used. This different way under Falcon with fVDI is used for display
good icons on the desktop under TOS 4.0X, why not...
Aniplayer cannot use the method with the standard format of the VDI,
it's too slow, you can see the results with the 1st AVI player (the
author of GEMview), thanks to D. Fiebelkorn. So I need to use specific
format and screen informations.
I hope that my answer isn't too long ;-)

Regards,

Didier.

No, but it should work.

> (the one having a multitasking AES; Ok, I know it's far from perfect...)?

It has an multitasking AES, but this AES is really not a good one. It's same
one as used in old Multitios, AFAIK. Is much better to use some new AES,
like XaAES or N_AES.

> >Second. Aranym is pretty usable, yet. It has full 68040 and (fast !)
68882
> >emulation
>
> I understand that only the sources are currently available. Any particular
> reason for not making available the executables for the currently usable
> platforms as well (understanding, of course that this is not a finished
> product)?

Well, it is developed mainly for Linux, so it's very easy to download
sources and then type "./configure"
and "make" for everyone with some Linux setup. However, the binary relase is
planned as well as the complete distribution.
There is also unoficcial Aranym for Windows (binary) and Sprac Solaris.

> Has there been thougts or efforts on making it run on certain hardware
> without an underlying OS

Currently not. Aranym is primary for PC and there is no chance to write
drivers for all available PC hardware from scratch. Maybe we can do Aranym
"HostOS free" for Palmtops or so, but never for PC like computers.

> (or, at least, with a hidden underlying OS)?

Definitely yes ! That's the main idea. Aranym needs only Linux kernel with
framebuffer support and SDL library. There is no problem to boot Linux
kernel masked by some fullscreen logo and then start the Aranym.

Ctirad

Hmm, I've just tried it again in HQ and it worked! I wonder what combination of things then causes it to fail....or maybe the camera didn't save the image properly. A bit worrying - I need to find out what causes it as I don't want to go out and take loads of photos and then find I can't read them! But everything I've taken since my last post has worked.

>doesn't get bogged down with the errors Peter gets.

High Harry!

I had thought of doing this BUT it would mean an extra phonecall for me as I still have to access Cix for conferencing. As most of my Cix blinks (including Usenet) do not exceed 2 minutes (unless I am dowenloading a file) it just doesn't work out financially.

I am still puzzled why some messages crash CixRead. It's rare, but repeatable (with the 'faulty' message). Must be something in the reply header, I guess.

What do you mean with CixRead not threading? If you mean putting topics together, though useful it doesn't worry me too much: I suually blink daily and then delete the read stuff, so it's not too difficult to find your way around. In any case the arrival dates seem a bit mixed up anyway, so I am not sure whether threading would sort this out.

But as my son has just got a Freeserve account, I might try using that the way yoou suggest.

Regards, /Peter/

When you click Print in Works you should get a dialog to select
available printers that NVDI knows about. In my case I have 21 for
my PCL.SYS and 25 for PIN.SYS available. 21 is set as my default
printer in NVDI.INF. In your cases it should be 25, presumably.

Do you have the font paths set correctly in NVDI.INF? Do you have
the various fonts available on the screen? Do you have the correct
*.SYS files in your GEMSYS folder and does NVDI.INF have the
correct path to it?

>> > MAGIC?
>>
>> You should just print from Atariworks, I'd guess...

Yep - just click Print, then select the correct driver.

Hi Lyndon!

I am not sure that he understands English. Try sending them (as
well?) to Ulf Dunkel at dunkel@calamus.net who distributes it, and
reads/writes excellent English.

Regards, /Peter/

The author surely understands English.
Also be aware Ulf Dunkel is away for a few days.

There is nothing wrong at this very moment on the chapelie. The server
is up and running. I tried it myself and had not problems to
access/download Newsie.

Which ftp-program did you use? Have you used the right login and
password?
login: ftp or anonymous
password: valid email address

>there are no function who returns the transformation caused by fVDI.

There have been two problems with vq_scrninfo under fVDI/Eclipse.
One of them an actual bug and one simply a matter of definitions.

>For information, there are _NO_ transformation in Intel format with the
>other drivers (like NVDI, NOVA cards, etc..) when the specific format
>is used. This different way under Falcon with fVDI is used for display
>good icons on the desktop under TOS 4.0X, why not...

The problem under fVDI/Eclipse (don't know about the other graphics
cards) is that the actual frame buffer is byte swapped. For the normal
Falcon desktop to work with that in 16 bit colour, I have no choice but
to swap the bytes when doing vro_cpyfm.

However, vq_scrninfo has under fVDI always reported the way the frame
buffer actually looks, not how it's supposed to be used by vro_cpyfm.
That is, it normally returns information you'd need if you wanted to
write directly to the screen, bypassing the VDI.
I have recently added an option to the RageII driver that will cause
it to return values relevant to the VDI from vq_scrninfo instead.

Besides this problem of definitions (whether vq_scrninfo should return
real or 'VDI' screen layout information), I had also managed to get the
bit order information reversed, but that has been fixed in recent
versions of the RageII driver.

You think, after all these year without a Falcon030, I'd actually REMEMBER the case dimensions? Shoot, even when I owned it, I didn't know... or care.

However, I'm sure the dimensions are a tad smaller without the metal casing and fan... but perhaps still too big.

Hey, it's a start. Not that it matter really anyways. I'll never spend my money on it anyways... I'd rather spend $400 on an old PowMac G3 B&W and upgrade it with a $300 G4 processor upgrade and 1Gb of PC100 RAM than the $500+ for an ultra antiquated Falcon030 and then an extra $300+ for an upgrade that *might* bring it up to PowerPC 603e performance, if even that. And the software support... well... let's not even go there, shall we?

So, where's the URL to someplace that actually makes one of these genuine microATX power supplies? Not for my sake, but for others, going to buy the CT60 for their Falcon030's.

>
> The problem under fVDI/Eclipse (don't know about the other graphics
> cards) is that the actual frame buffer is byte swapped. For the normal

I know...
So this is a short part of NVDI documentation:

```
-------
vro_cpyfm
COPY RASTER, OPAQUE copies a rectangular raster onto another rectangular
raster and performs the specified logic operations.
Both rasters must be in device-specific format or they must have only
*******************************************
one plane.
-------
```

So if the input is in 15 bits motorola, the output is 15 bits motorola
- 16 - - 16 -
- 24 - - 24 -
- 32 - - 32 -
- 15 intel - 15 intel
- 16 - - 16 -
- 24 - - 24 -
- 32 - - 32 -

So if the user cannot uses vq_scrninfo for support all modes, vr_trnfm
must be called before (a slow method).
For me swap bytes inside vro_cpyfm is a bad idea, It better to create
for the TOS 4.04 and AES patch for swap bytes inside GCICON (I don't
know if another problem exist).

> Falcon desktop to work with that in 16 bit colour, I have no choice but
> to swap the bytes when doing vro_cpyfm.

Regards,

Didier.

Yes and no. The guy who develops Thing has said to me he certainly will
release Thing 1.30 but he didn't told me when. I've seen Thing 1.29
working and I must say it looks nice. One can have background pictures
in the windows just like Jinnee and the most important the long file
name restriction is gone. I believe the current version of Thing can't
handle names longer then 32 chars.
However I'm afraid v1.30 will be the last one

>Is the adress gryf@hrzpub.tu-darmstadt.de still valid ?

AFAIK, yes

>How can I register Thing ?

I should say send an email to Thomas Binder

I've just got a Print-Technik Universal Scanner. It's very old fashioned
but I got it for free so I don't complain.
It's a Black/White 200dpi scanner with 15 pseudo greyscales and a built-in
thermo-paper printer made by Silver Reed.
The software that I got with it does run on my old ST but not on my
Falcon. I tried Backwards III with a little result, but not much. I found
an ATOS article somewhere on the net about this scanner, saying there is a
patch to fix software problems. Anyone who can help me to get this oldie
running with my Falcon ?

6273. Beyond Atari ST/Falcon (ie. Hades, Medusa, PowerPC)

Newsgroup: comp.sys.atari.st
Date: 2001-12-31 18:43:32 UTC
From: Mike Stepansky <design3d@2-scale.com>
Message-ID: <B8561C04.1BDB%design3d@2-scale.com>
Source record: 39242

To die-hard ST'ers or Falconers,

I used to have Atari 520ST from 1986 up until 1991. I fell love with it and use it for GFABasic graphics programming and games. I was thinking of either getting STacy (running a Mac emulator by Dave Small?) or Atari Mega STe.

After attending the DTP trade show in Chicago, I was thinking about getting Atari TT or a Mac II LC (the thin type with 040 in it) for graphics capability, like the Pixar Renderman software.

But then in 1992, I got hired as a 3D animator in one of the video post houses in Chicago. Unfortunately, I was out of touch with the Atari ST world because I had numerous projects to do on a SGI graphics workstation as well as on a Mac.

Then in 1994, my last newsletter subscription ended with AtariWorld (?) (or was it APE newsletter for Atari Lynx users?). I was reading an article about Atari Falcon/030 and Jaguar. I was thinking of getting a Falcon but wasn't sure how or where to get one.

Then time went by, I heard about an unusual Atari computers like the Atari Hades/040 (in 1995 or so) and then (in 1998 or so) the Atari Medusa/060 and then recently rumored surfaced about the PowerPC version of Atari computer.

Are these real Atari computers beyond the Falcon/030?

In summary, you see here:

Atari Falcon/030 (which I know Atari released it in 1994)

Atari Hades/040 (Atari Germany has it? Who has it?)

Atari Medusa/060 (who has it?)

Atari PPC (is this real? I read somewhere in the web long ago)

Atari PC (it came out in 1987 before it died out...but I wonder if Windows 98 or better can be upgrade on it? I doubt it because it is either a 286 or a 386 versions)

Atari Abaq (it is real but this is just a RISC transputer for parallel processings using 4 INMOS cpus in a farm card, yielding 40 MIPS, for a max of 320 MIPS in a Polyhedra Box; first saw it in SIGGRAPH 1989, as another options for a graphics supercomputing systems.)

Let's hear the summary of those hardware specs in general from you. I would like more know about where to get/see Falcon, Hades, Medusa.

How common (or rare) for someone to have a Hades or Medusa?

Mike
2Scale Inc.

Message-ID: <yl2Y7.565$RK5.45999@newsfeed.slurp.net>
Source record: 39243

There is indeed Atari clones around. I know of quite a few people with them and I'm sure they'll reply to your post as well. You left out the Milan computer which is made by Milan in Germany. It is a 040/060 and quite popular. The Medusa/Hades was produced by a Swiss company and they are still around.

Just to let you know, Atari is owned by the game company Infogrames and they have no desire to develop computers or have anyhing to do with them at this point.

The PPC system you mentioned is an accelerator card being developed for the Atari Falcon and possibly for the PCI-based clones. Development has been very slow lately but we hear news about it every now and then.

The is also a new project to make a clone using the latest ColdFire CPU which is the successor to the 68K family. You can read about that at http://www.xtos.de

Rodolphe Czuba is almost done with his 060 accelerator for the Falcon. More info at http://www.czuba-tech.com

Hope this helps.

Joshua.

The MagiC 6.20 is a great step into compatibility with MiNT. Several
routines is re-written, fork()...

I am still having a great time with my Sony Mavica. Puts the images
right to 3.5 inch disk. Works great with PhotoTp, Smurf and ImageCopy.
Maybe one day I will upgrade to the CD version of the camera, but $1500
is too much....

Yes, that is enough. I just sent him an email a few days ago and have received two replies. Cannot imagine what your problem is... Are you a registered user like me?

No, he does undersand English. My emails have been in English and his
replies are English, but then, maybe he uses a translator....

I have used this program before. It is ok, but needs an upgrade.
Highwire, when it comes out, will surpase any browser on the Atari.
Goto: http://highwire.atari-users.net and take alook....

Hmm, I don't know why the author doesn't care to reply to your mails. He
always has responded very quick to my mails.

TTYS,
Martin

AFAIK, it doesn't matter if you're a registrated user or not. I'm only a
registrated user since a few days. In the past the author always
answered my postings although he did know I wasn't a registrated user.

Wensuite is far better then Adamas and it's incredibable fast. Where Cab
takes almost two minutes to load a page with 13 mid-size progressive
jpg's Wensuite does the same job in 20 sec. My guess is that to get that
speed they had to make a compromis between speed and display quality.
It's a pity the development of Wensuite is put on ice.

TTFN,
Martin
